STORMS (Continued)

On July 19th and 20th severe thunderstorms with rain, hail and high winds struck the South Plains. Several thousand acres of cotton were destroyed west of Littlefield on the 19th. Hail in some places was 8 to 10 inches deep in level fields. A farm worker was killed near Littlefield by lightning. Several hundred acres of cotton were destroyed or badly damaged, west of Tahoka on the 19th and east of Tahoka on the 20th.

On July 20th a thunderstorm formed near Waco about 5:00 p.m., bringing rain up to 4.00 inches in the south part of the city. A furniture store was badly damaged when a water tower on top of the store crashed through the roof. A few hailstones were seen up to baseball size. Lightning destroyed a barn and hay east of town. Winds with gusts to 50 miles per hour unroofed several houses and blew down trees and TV antennas. Damage was estimated at $100,000. A small tornado was reported near San Saba. A ranch house was unroofed and a new stone house and several barns were damaged.

A man was killed by lightning near Huntsville on the morning of July 21st.

On July 24th two small tornadoes struck about 2:30 p.m. near Rendon in Tarrant County. The first destroyed one barn. A 2 by 4 board was driven one foot into the ground 150 to 300 feet away. A pipe was pulled from a well. The second struck a barn, unroofing it. A 2 by 6 board was carried 400 feet. About the same time at White Rock Airport near Dallas, wind gusts estimated at 65 miles per hour destroyed or damaged six light planes. In Hale County a hailstorm struck west of Hale Center about 5:30 p.m., in the same areas as the storm of July 4th, and damaged several hundred acres of cotton which escaped the first storm. About 6:30 p.m. a tornado struck at Carthage in Panola County. Several homes were damaged, garages destroyed, and trees uprooted. A boy was injured by flying glass.

On July 26th the Highway Patrol reported a tornado funnel aloft between Winnie and Galveston Bay in Chambers County.

On July 29th a windstorm struck at Greenville in Hunt County about 7:30 p.m., damaging three houses and a barn.

On July 30th a wind and dust storm swept through northeastern Midland County. Sixteen telephone poles were broken off near the ground and toppled onto U. S. Highway 80 by the force of the wind.

On July 31st a small child drowned northwest of Big Spring while playing in a normally dry draw, filled by a flash flood.

Richard D. W. Blood
State Climatologist
U. S. Weather Bureau
Austin, Texas

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas, or to any Weather Bureau Office near you.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables; but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

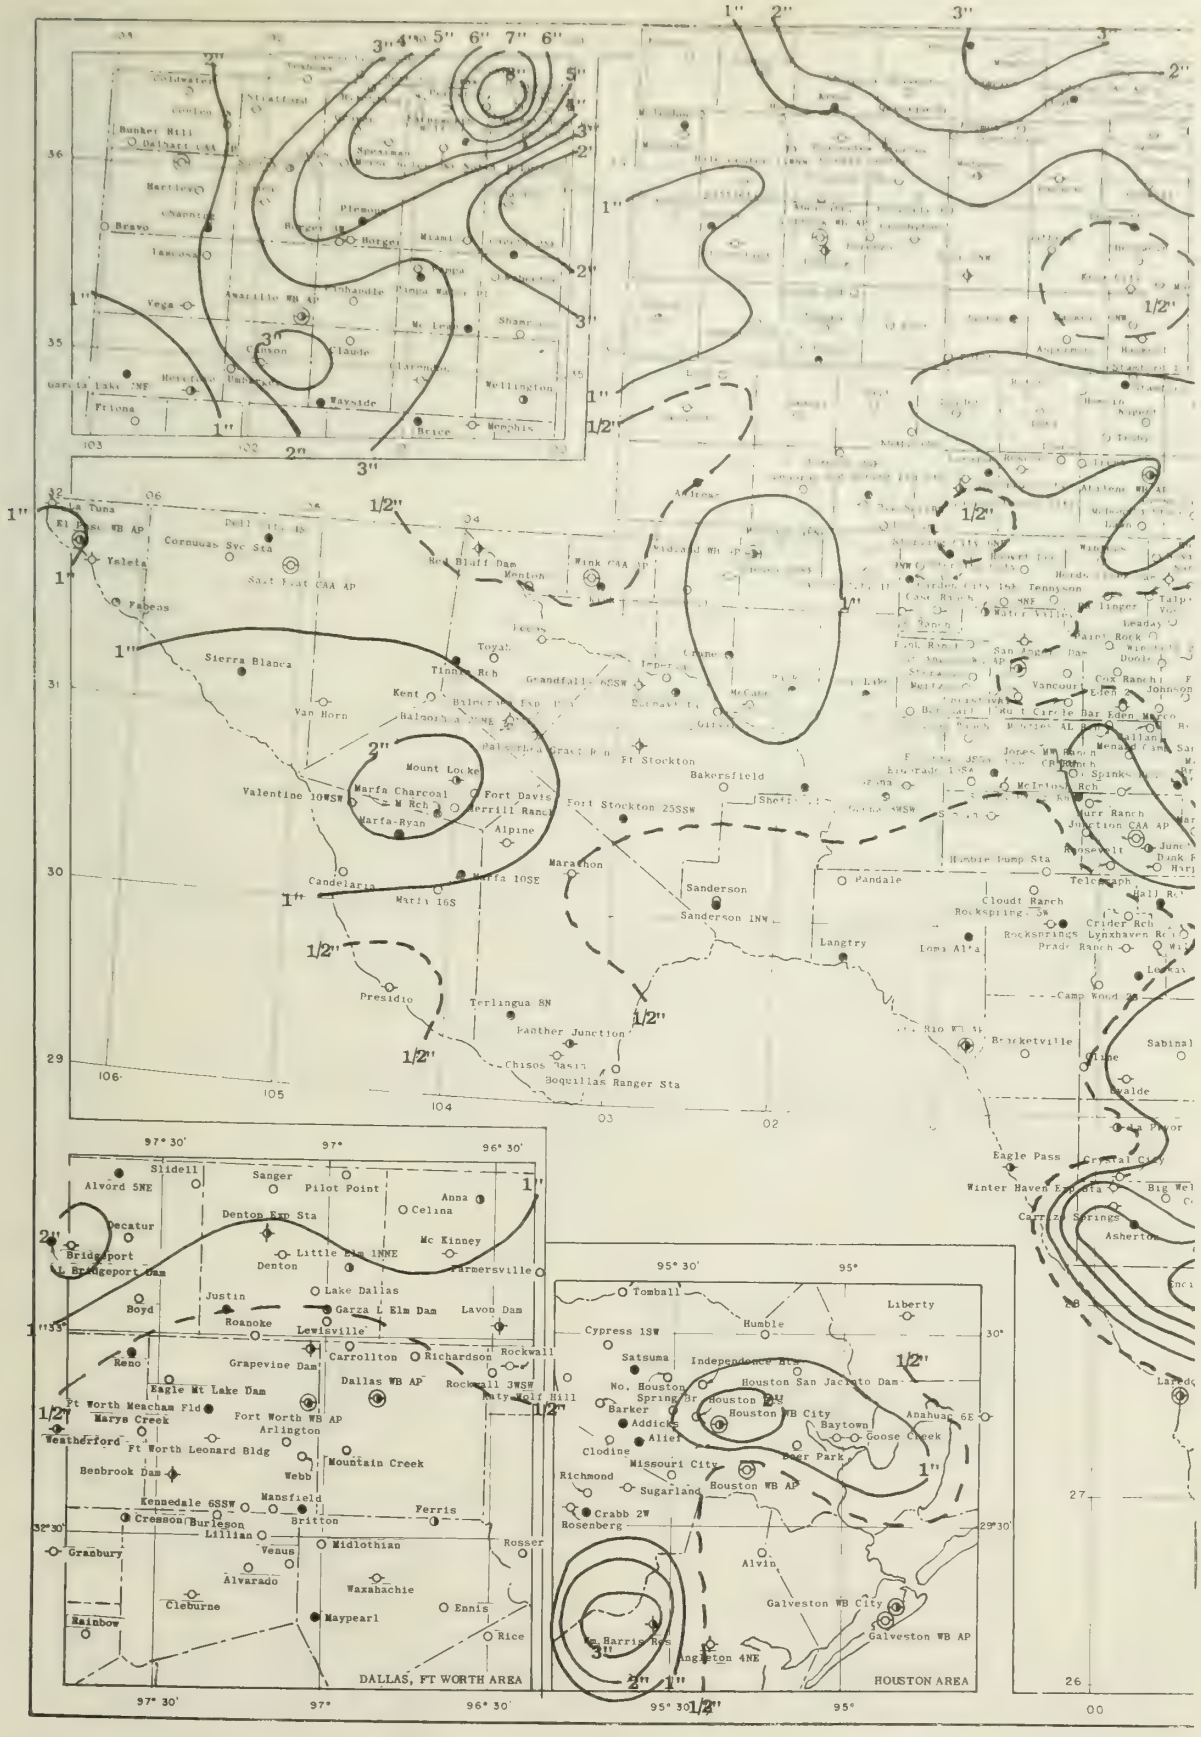
Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.



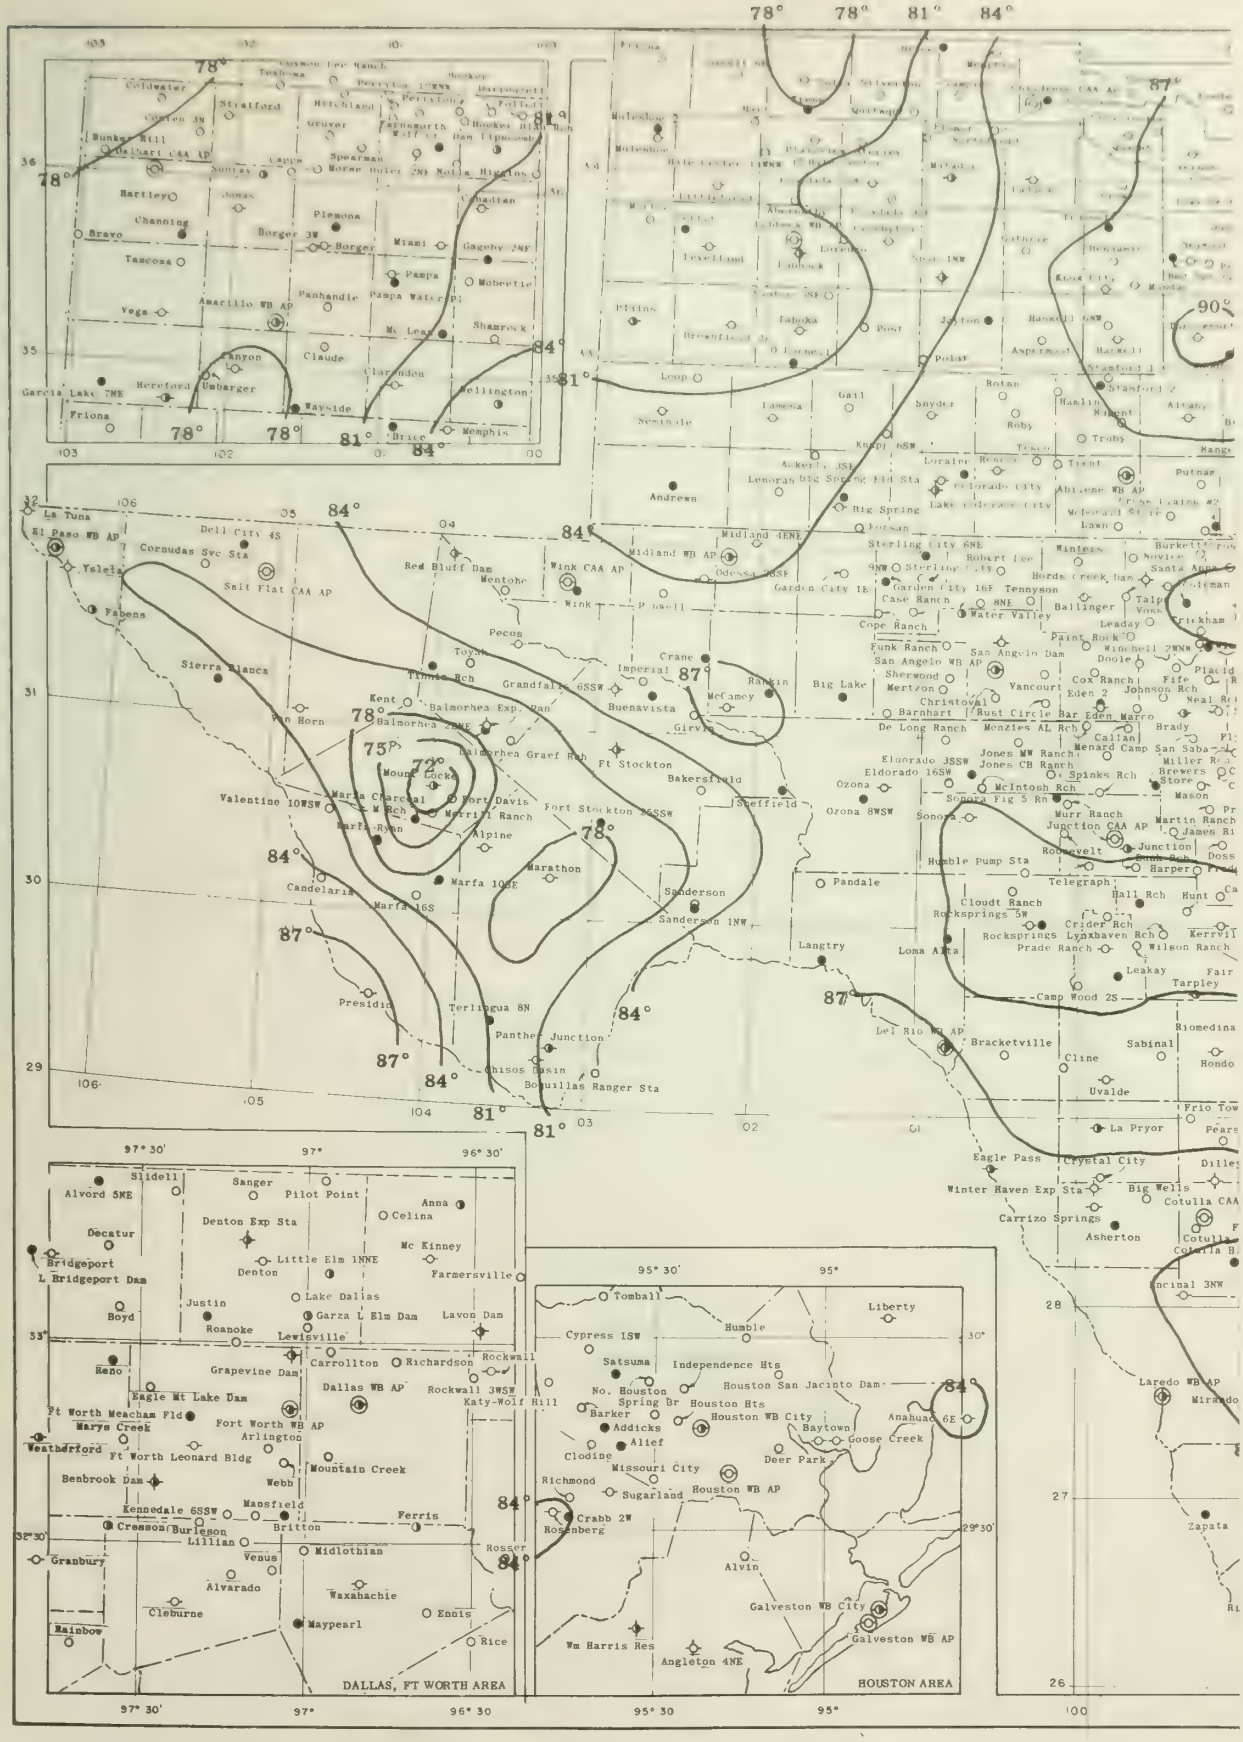
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published later in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NWRC, Asheville, N. C. -- 9-7-56 -- 1655

In this issue of the Climatological Data for Texas there is inaugurated a new presentation of precipitation and temperature data for the state. In January 1956 the decision to abandon the State means of temperature and precipitation was reached after careful consideration and consultation with the Advisory Committee on Climatology. Political subdivisions generally bear no relation to natural regions of topography, vegetation or atmospheric circulation, and averages of climatic data over such areas do not form a valid time series. In addition the number and location of stations change from year to year. The charts presented herein give a general picture of the distribution of precipitation and temperature over the state.



TOTAL PRECIPITATION

Isolines are drawn through points of approximately equal values.

JULY 1956

For further explanation see note following "Reference Notes".

MEAN TEMPERATURE

Isolines are drawn through points of approximately equal values.

JULY 1956

TEXAS - AUGUST 1956

WEATHER SUMMARY

August was hot and dry. Crop prospects over most of the State continued to decline.

The sizzling weather which had persisted for several weeks prior to the beginning of the month, continued until near the end of the third week. Dallas sweltered under afternoon temperatures ranging from 100° to 109° from August 2d to the 18th. Maximums reached 100° or higher at Del Rio on every day from the 3d to 19th. Afternoon temperatures at Wichita Falls soared to 100° or higher on every day from July 25th to August 18th. The highest temperature for the State, 112°, occurred at Gainesville on the 4th, 13th, and 14th, at Wills Point on the 5th and 14th, and at Bridgeport on the 17th. A cold front, which entered the State on the 18th, brought relief to most sections. The highest afternoon temperature at Wichita Falls on the 19th was 80° in contrast to 103° the day before. Amarillo registered 95° on the 18th and only 57° on the following afternoon. Less impressive temperature drops were noted over southern Texas. The lowest temperature for the month, 48°, occurred at Spearman on the 20th and 21st and at Clarendon on the 21st. The comparatively cool weather lasted only a few days. During the last week of the month, temperatures increased to near seasonal over eastern and southern Texas and rose to above seasonal over the northern and western portions. Some northern and western stations registered 100° temperatures on several afternoons during the last week. Monthly mean temperatures ranged from 70.9° at Mount Locke to 89.5° at Henrietta. Temperatures at most stations averaged above the long-term means. Temperatures at some northern and eastern stations exceeded the long-term means by more than three degrees.

Precipitation during the first eighteen days of August was limited to scattered showers of little consequence over the Panhandle, the Trans-Pecos, and a few eastern localities in the first week and a few more widely scattered sprinkles during the next week and a half. The cold front which crossed the State during the last half of the third week produced general showers throughout the State and locally heavy showers at a few stations on the High Plains and at widely scattered stations elsewhere. Most of the showers fell on the 19th and 20th. The important precipitation during the last ten days was the locally heavy showers along the coast and in south Texas on the 26th and 27th and a few widely scattered heavy showers on the 31st. Monthly totals ranged from no rain at several stations to 5.88 inches at New Braunfels. Many localities received less than one-tenth inch and wide areas in south Texas, and parts of the Edwards Plateau, west Texas, the southern High Plains and the northern Low Rolling Plains received less than a half inch.

Some localities which received more generous rainfall were centered around New Braunfels, Crystal City, Madisonville, Rusk, Dalhart, Austwell, and Falfurrias. In general, most stations in the High Plains, the Low Rolling Plains, the Blacklands, Trans-Pecos, and Edwards Plateau received less than 40% of their long-term means for August. Many stations in those areas received less than 20% of their long-term means. Precipitation over eastern and southern Texas ranged widely from 1% of the long-term mean at San Benito to 213% at Falfurrias and Palestine.

Cotton and feed crop prospects in dryland areas of the northwest and rice prospects in upper coastal counties continued to decline during August. Irrigated cotton, sorghums, and hay in the High Plains and Trans-Pecos were in very good condition. Late August rains revived hopes for fall pastures and late feed along the coast and in south Texas. Wheat seeding started about on schedule. Some growers in the extreme northern High Plains started planting by the middle of August. By August 31st, planting north of the Canadian River was well underway. Some acreage was dusted in; other growers waited for rains. Stream flow was critically deficient except in south Texas where moderate flooding occurred during the last week of August. Several times during the month runoff in scattered areas followed isolated thunderstorms but relief from the drought was not general. Storage reached a record low in most river basins.

Lucius W. Dye, Climatologist
Weather Records Processing Center
U. S. Weather Bureau
Kansas City, Missouri

STORMS

A brief windstorm lasting only five minutes ripped about 5,000 feet of sheet metal roofing from a finished brick storage building at Crush, southeast of Sulphur Springs. The storm struck at 4:25 p.m. Flying metal broke several feeder power wires. Two concrete-set power line poles were pulled out of the ground. This was on August 1.

High winds along the northern coast were associated with some thunderstorm activity on the 2nd. In Harris County, during a rain shower winds tore off the corrugated iron roof of a barn, and a smaller barn 50 by 12 feet was blown down. A third small barn and a power line were knocked down.

High winds on the 8th hit the western section of Byers in Clay County about 4:00 p.m. The storm which lasted about 10 minutes caused roof damage to the school, knocked TV antennas from roofs, smashed windows and reportedly lifted a home from its foundation, then dropped it back in the same spot. The impact split the house and cracked off a room from the rest of the dwelling. Phone and power lines were damaged. An observer reported "looked like a rope hanging from the clouds."

On August 14 about 6:45 p.m. strong southerly winds (estimated at 60-70 mph) struck Arlington, Texas. Trees were uprooted, roofs of houses were blown off, and barns were blown down.

On August 14 a small tornado with some rain hit Britton at 6:40 p.m. Roof of cotton gin was blown almost a mile across the fields; several outbuildings destroyed; a building 20 x 30 feet was moved from its block foundation about eight feet. Sheet metal from the gin was strewn in a line from the gin to a point one-half mile northeast.

On the 18th a cool front moving in a northwest-southeasterly direction entered the Panhandle. High winds and thunderstorms accompanied the front. At Perryton, shortly after 3:00 p.m., hail which started as small round stones soon turned into large jagged chunks of ice which ranged in size from golf balls to turkey eggs. All windows on the north side of the elementary school, a hospital, the courthouse, and all the churches in town were broken. Several hundred automobiles were damaged by hail. Television antennas were broken. Heavy rain followed the hail. Water filled the streets from curb to curb and flooded the south end of the main street.

As the cool front moved southeastward, Wichita Falls experienced its heaviest rain in 11 months, on the 18th. The rain began at 8:10 p.m. and continued until 10:00 p.m. An inch fell in 20 minutes, and a total of 2.38 inches fell during the period. South-southwesterly winds of 40 mph with strong gusts to 58 mph occurred. The peak gust was 67 mph. Rainfall was variable in the area. Wind damage was light.

On the 20th a heavy thunderstorm in the Rockport area caused heavy rains and strong winds. Two to three inches of rain fell in a short time and winds estimated at 80 mph damaged barns and blew tin roofing one-fourth mile. Some cotton trailers were damaged.

At Agua Dulce on the 20th rain of three inches and winds of 70 mph occurred between 5:00 and 6:00 p.m. with cold frontal passage.

(Continued on Page 194)

STORMS (Continued)

On August 28 thunderstorm with high winds unroofed a dairy barn, a milking shed, scattered bales of hay over the college campus at Decatur. Lightning knocked out a transformer and started two small fires. Utility poles were knocked down.

On August 29 high winds associated with heavy thunderstorms moved across north central Texas. A tornado funnel was reported one mile north of Boyd in Wise County. Chicken houses, a barn, and other outbuildings were destroyed. No one was injured. The reported funnel was followed by heavy rain and hail. Other funnels were sighted on the 29th at Garland and Richardson but did no damage. Lightning and hail disrupted electric power at Weatherford and some Dallas suburbs.

On the 30th a squall line moved into north central Texas. Associated with the squall line were high winds, rain, and hail. Roofs were torn off four houses and six barns at Sulphur Springs. The wind disrupted electric and telephone service in that community. At Greenville winds were recorded at 65 mph. They ripped roofs off houses, smashed plate glass windows, snapped tree limbs and broke television antennas. A number of fires were started around cotton gins. Hail damaged pecan trees near San Saba and broke windows. At Hillsboro a drive-in theater screen was blown down.

As the squall line moved southeastward on the 31st thunderstorms, gusty winds, and hail varying in size from one-fourth inch to two inches moved through central Texas. A few unconfirmed tornado funnels were sighted. Damage was confined to TV antennas, windows, roofs, and outbuildings.

FLOODS

On August 19 as a weak cold front pushed downstate, locally heavy rains of two to six inches fell on the upper Nueces and Frio watersheds in advance of the front. Heaviest amount was three to six inches on the Frio near Knippa. Due to the extreme dryness, flooding was limited to the area of heaviest rainfall.

On August 25-26 the movement of a weak easterly wave over south Texas caused locally heavy rainfall of 4-7 inches over the middle Nueces, lower Frio and the Atascosa Rivers, and some of the Gulf drainage streams.

San Miguel Creek was reported on the biggest rise (25-26th) since 1946. The middle Nueces from above Tilden Crossing to Three Rivers was above flood stage from the 27th to 31st. The lower Frio was above flood stage or out of banks from the 27th to 29th. Flooding on the LaParita Creek resulted in flooding of low places on Atascosa from the 27th to 29th. Damage was confined to bridge and road structures and erosion damage to fields.

Richard D. W. Blood
State Climatologist
U. S. Weather Bureau
Austin, Texas

(A) Evaporation measured in a sunken pan of 24-inch diameter. (C) Evaporation measured in a screened, sunken pan of 48-inch diameter. Max and min in table 6 refer to extremes of temperature of water in pan as recorded during the 24 hours ending at time of observation.

See reference notes following Station Index.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas, or to any Weather Bureau Office near you.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables; but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published later in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

ASHEVILLE: 1956

TEXAS - SEPTEMBER 1956

WEATHER SUMMARY

September was sunny, hot, and very dry. The cumulative effects of six dry years, of half the seasonal rainfall since January 1956, and of one-fifth the average rainfall in September were low yields of dryland crops, hay and roughage supplies far short of winter needs, pastures eaten to the bare ground, short or exhausted stc stock water supplies on many farms, and record low soil water levels.

Near-seasonal temperatures prevailed during the first few days of September. Maximum temperatures were mostly in the 90s. A cold front which moved through the State on the 5th and 6th dropped maximum temperatures over much of the State 15 to 20 degrees. Amarillo registered 90 degrees on the afternoon of the 5th and only 69 degrees on the afternoon of the 6th. Southerly winds on the 10th started a prolonged mild spell which continued, with minor interruptions, to the end of the month. The period 13th to 21st was especially warm, and most stations registered their highest maximums for the month during that period. Maximums were near or slightly more than 100 degrees at most stations. Monthly maximums lower than 95 degrees were registered at a few stations along the Gulf. The lowest monthly maximum temperature, 87 degrees, occurred at Mount Locke on the 15th and 16th. The highest maximum, 106 degrees, occurred at Presidio and Sherman on the 15th and 16th and at Albany and Kaufman on the 19th. The monthly minimum temperatures ranged from 39 degrees at Stratford on the 30th to 70 degrees at Port Isabel on the same date. Monthly minimums were in the 60s along the Gulf and at a number of inland stations. They were in the 40s over the Panhandle and over much of the Trans-Pecos. Elsewhere, monthly minimum temperatures were mostly in the 50s. Monthly mean temperatures ranged from 68.5 degrees at Mount Locke to 84.1 degrees at Laredo Weather Bureau Airport. September temperatures averaged slightly below the long-term means in the Brownsville area but above the long-term means over the rest of the State. In general, the monthly mean temperatures were less than one degree above the long-term means over southern and south central Texas and along the Coast; from one degree to two degrees above the long-term means over most of the Trans-Pecos, over the Edward's Plateau, and over parts of east Texas; from two to three degrees above the long-term means in the El Paso area, over the southern plains, the southern Blacklands, and in northeast Texas; and more than three degrees above the long-term means over the Panhandle, the northern plains, Cross Timbers, and the northern Blacklands.

Light widely scattered showers fell on several days during the first two weeks. The period, 14th to 28th, was mostly fair with very few sprinkles. Brownsville received a shower on the 29th and showers fell along the coast on the 30th. Numerous stations in the plains, Cross Timbers, Blacklands, and east Texas received no rain during September. Most stations in those areas and in the Trans-Pecos received less than one-half inch. Most stations in southern and south central Texas and along the coast received more than an inch. The greatest total rainfall, 4.50 inches, fell at Jourdanton. Some stations in southern and south central Texas and along the coast received more than half their long-term means. Other stations in those areas and most stations in other parts of the State received less than one-fourth their long-term means. For the State as a whole, rainfall averaged between one-fifth and one-fourth of seasonal and it appears that September 1956 was the driest September of record.

Harvesting of mature crops in irrigated areas gained momentum during September and salvaging low-yielding cotton and sorghums in dryland areas moved along. Scattered showers early in September, with the more generous amounts along the coast and in south Texas, temporarily revived hopes that the drought might have eased. The hopes were of short duration, however, as temperatures soared above 100 degrees and steady winds sapped the moisture from the surface. Most of the wheat planted in the northern counties following the August showers was up but needed rains to survive. Some Plains farmers "dusted in" wheat. Others waited for rains before risking seeding. Large acreages in the central, northern, and eastern counties were prepared for seeding. Range and pasture conditions, which had been at or near the low level which occurred during the 1934 drought, deteriorated below that level in September 1956. Many pastures in the central, western, and northwestern counties were bare. The entire State, except five counties in the southern High Plains and 31 counties in the southeast and along the coast, was included in the drought emergency area. No wheat or oats pastures were expected to be available without rains. Cattle and calves continued on the downgrade over much of the State. Culling and the liquidation of herds were expected to continue unless rains revived feed prospects. Ewes and lambs were in generally poor condition in the sheep country. Ranges were bare and most sheep were being maintained by supplemental feeding. Production of cotton was below average in all dryland districts except the Coastal Bend where the crop got an excellent start ahead of the drought. Record high yields were expected from irrigated acreages in the northwest and in the Trans-Pecos. Production of commercial vegetables for fall harvest was expected to be greater than last year. The prolonged and intensified drought caused the flow in most Texas rivers and creeks to be critically deficient. Many streams reached record-low stages. Some slowed to a trickle; others ceased to flow or dried completely. Although relief was experienced locally, soil water levels generally were at record-low levels. Four of the five key wells reached all time low levels and the level in the fifth was the lowest on record for the month of September.

U. S. Weather Bureau
Kansas City, Missouri

STORMS

On September 3d, six people died by causes attributable to turbulent weather in Central Texas, including one man who was hit by lightning. High winds, hail, and rain lashed across an area between Waco, Austin, Victoria, and Houston. Roofs were ripped off by the winds, a tenant house was blown away, and a larger house lifted off its foundation while another was badly damaged.

On September 4th, a tornado moving from the northwest touched the ground at Georgetown 20 miles north of Austin, Texas, at about 4:00 p.m. Heaviest precipitation since last May, 0.84 inch, fell during the time of the high winds which ripped roofs from several buildings. The tornado moved on, to touch again at Lexington approximately 45 miles east of Austin for 10 to 20 seconds. A small frame church at Lexington was blown off its blocks and will have to be rebuilt.

September 7th between 5:00 and 5:20 p.m., a small twister moving from southeast to west hit Zapata on the o Grande about 50 miles south of Laredo, Texas. Two tourist courts were unroofed and several utility poles re knocked down. In one-half hour the city was drenched with a rainfall of 2.85 inches.

September 7th, a high wind moving from southwest to northeast and accompanied by rain and light hail caused nsiderable property damage at Mount Calm, a small community 28 miles northeast of Waco, Texas. Roof of bank ilding blown off; another building and several barns blown down.

September 23d, Hurricane Flossy caused high tides and rough seas in Corpus Christi area. Highest tide ading was at Port Aransas on September 23d and was 3.0 feet above the mean low water level. Beach roads der water on the 23d and two cars trapped on the beach and a portion of a fishing peer at Port Aransas were shed away.

State Climatologist
U. S. Weather Bureau
Austin, Texas

HURRICANE AND TROPICAL STORMS WHICH AFFECTED THE CORPUS CHRISTI AREA

e following paragraphs are from a report prepared by the Weather Bureau Office, Corpus Christi:

eptember 11-12, 1956: Tropical Storm "Dora" developed in the southwest Gulf of Mexico on the 11th and ved inland near Tuxpan, Mexico, on the 12th. Highest tide at Port Aransas was 2.6 feet which occurred on e 11th. Water covered the beach roads on the 10th and 11th. Highest winds at Port Aransas were 25 mph on e 10th and swells there were reported 12-14 feet on the 10th and 11th. Navigation Swing Bridge reported a de reading of 3.0 feet during a brief shower on the 10th. An oil rig off Gulf Park reported winds from e north-northeast at 30-35 mph and 10 to 12-foot seas on the 10th. Padre Island Swing Barge Bridge had rth-northeast winds 33 mph during the afternoon on the 10th. Murdock Pass had five-foot swells and tides o feet above normal in the lagoon on the 10th. Wind at Cliff Maus Field on the 10th was 24 mph which was e fastest mile on that day, and 26 mph was the fastest mile on the 13th. Cliff Maus Field measured only trace of rain during the tropical storm on the 11th. Scattered showers and thundershowers occurred in e area and radar picked up echoes southeast of Corpus Christi.

eptember 22-29, 1956: Hurricane "Flossy" developed about 450 miles south of New Orleans on the 22nd. This rricane moved northward and northeastward, the eye passing over Burrwood, Louisiana, on the 24th, and went land between Pensacola and Apalachicola, Florida, during the evening of the 24th. The only effects felt in e Corpus Christi area were high tides and rough seas on the 23rd and 24th. Highest tide at Port Aransas s 3.0 feet above the mean low water level on the 23rd. Highest reading at Navigation Swing Bridge was 2.8 et above the mean low water level on the 24th. Beach roads on the island were under water on the 23rd and th. Two cars were trapped by high water. One hundred feet of Port Aransas fishing pier was washed away by avy seas.

eptember 29-30, 1956: A tropical disturbance developed on the 29th about 150 to 200 miles northwest of rida, Mexico. Showers and thundershowers developed over the west Gulf and squalls with winds 30 to 40 mph curred over the northwest Gulf. The weak low pressure center moved north and northwestward and went inland ar Galveston, Texas, during the late afternoon of the 30th. Seas were running about five feet off Port ansas and Gulf Park on the 30th. Highest observed tide reading at Port Aransas was 1.9 feet above the mean w water level on the night of the 30th and morning of October 1st. Scattered showers and thundershowers oc- rred along the Texas middle coast with only light spotty rainfall over land. Two hundredths of an inch was easured at Cliff Maus Field on the 30th. The beach road was under water in some places on the 30th and a w cars were stuck in the sand as they moved to higher ground to avoid the water."

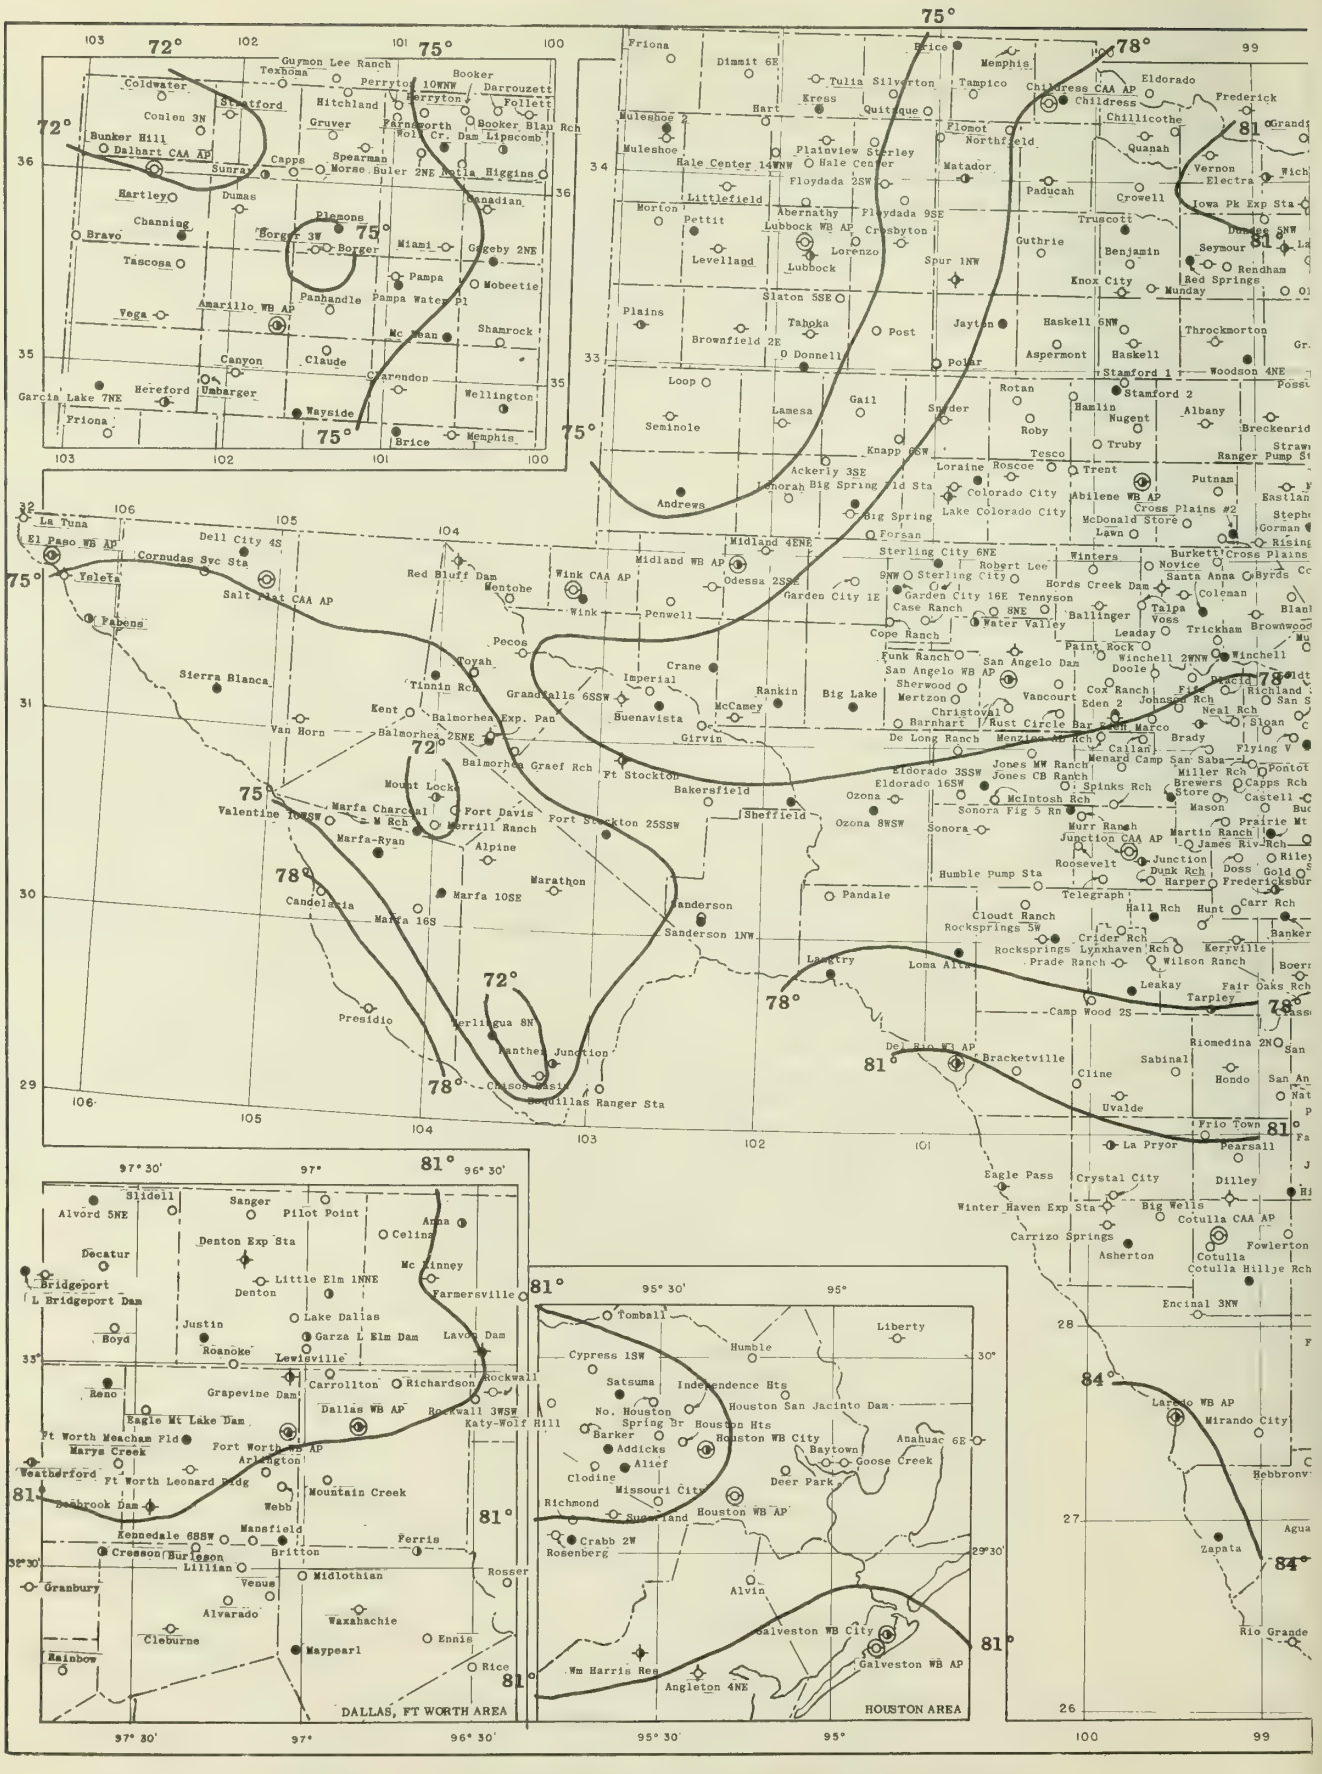
(A) EVAPORATION MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER. (C) EVAPORATION MEASURED IN A SCREENED, SUNKEN PAN OF 48-INCH DIAMETER. MAX AND MIN IN TABLE 6 REFER TO EXTREMES OF TEMPERATURE OF WATER IN PAN AS RECORDED DURING THE 24 HOURS ENDING AT TIME OF OBSERVATION.

See reference notes following Station Index

Total Precipitation (Inches), September 1956



Isolines are drawn through points of approximately equal values.

Total Precipitation (Inches), September 1956

Isolines are drawn through points of approximately equal values.

Average Temperature (°F.), September 1956

Isolines are drawn through points of approximately equal values.

Average Temperature (F.), September 1956

Isolines are drawn through points of approximately equal values.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1115 Mueller Blvd., Austin 2, Texas, or to the Weather Bureau Office near you.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 1' NSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building. Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rains.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C" are processed for special purposes and published later in Hourly Precipitation Data.
D	Water Equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Information concerning the history or changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary). Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS - OCTOBER 1956

WEATHER SUMMARY

Mild dry weather continued through most of October. Rainfall was spotty. Many stations received less than one-fourth their long-term averages for the month. Several received more than twice their long-term means. In general, most stations received considerably less than their long-term means. The fine weather was ideal for harvest which moved along rapidly to the final stages.

Mild temperatures prevailed during the first half of October. Afternoon temperatures were warm and comfortable. Nighttime temperatures were cool and invigorating. Most stations registered their highest temperatures for the month during the first few days. Numerous stations in the High Plains and in the Low Rolling Plains registered their highest maximums on the 8th. Monthly maximums ranged from 82 degrees at Mount Locke on the 4th and 5th to 105 degrees at Eagle Pass on the 4th. Monthly maximums were in the lower 90s along the eastern edge of the State, along the Upper Coast, and over most of the western Panhandle. They were in the upper 90s over most of the rest of the State except in counties bordering the Rio Grande from Del Rio to Rio Grande City, where the temperatures exceeded 100 degrees on one or more days. Several cold fronts crossed the State during the last half of the month bringing more variable weather. One of the cold fronts moved across Texas and over the Gulf on the 20th, another on the 24th and 25th, and the last on the 29th and 30th. Lower temperatures accompanied the fronts but warm weather returned quickly following the first and second of the frontal passages. The afternoons of the 28th and 29th were especially mild with temperatures in the 80s over much of the State. Some stations in the Rio Grande Valley registered 90 degree maximums on those dates. The temperature at Laredo reached 94 degrees on the 29th. A few stations along the Upper Coast and along the Coastal Bend registered their lowest temperatures for the month on the 22d. Over most of the State, however, the coolest morning was the 31st. Monthly minimums ranged from 62 degrees at Port Isabel on the 22d to 25 degrees at Ysleta on the 31st. Temperatures dropped to 32 degrees or lower at least once during the month at many stations in the High Plains and over the extreme western part of Texas. Monthly minimums were mostly in the 30s over the Low Rolling Plains, the Trans-Pecos, and the Edwards Plateau, in the 40s over the Blacklands, East Texas, and South Central Texas, and in the 50s over Southern Texas and along the Gulf. Monthly mean temperatures ranged from 60.1 degrees at Dalhart CAA Airport to 79.4 degrees at Port Isabel. Monthly mean temperatures were above the long-term means at almost all stations. Temperature departures ranged from -1.0 degree at Bronson to +7.2 degrees at Gatesville. Temperatures at most stations averaged between two and four degrees above seasonal.

Scattered showers occurred over the Blacklands and East Texas on the 1st. The Upper Coast received light to locally moderate showers on the 3d and 4th. The 5th to 10th was mostly cloudless with no important rains anywhere in the State. Most stations received their most generous rains during the period 14th to 20th. Daily totals exceeded one inch at many stations on one day during that period. Precipitation exceeded two inches on at least one day at numerous stations and three-inch rains occurred at a few stations. Fair weather prevailed from the 21st to 24th. Scattered showers occurred during the last few days of October. Several stations in the western portion of the Panhandle and in the extreme western part of Texas received less than one-tenth inch. Precipitation over the Trans-Pecos and over the High Plains was, in general, less than an inch. Larger totals were general over other portions of Texas with two and three-inch totals common in the vicinities of Bracketville, Robstown, Port Isabel, Nixon, Beaumont, Mineral Wells, San Angelo, and Henrietta. Several stations in East Texas, in the general vicinity of Athens and Palestine, received less than an inch. The greatest monthly total, 6.74 inches, fell at Henrietta. Precipitation exceeded the long-term means at scattered stations in many parts of Texas but most stations received less than three-fourths their long-term means. Most stations in the High Plains, in East Texas, and in South Central Texas received less than half the average seasonal amounts.

Harvest progressed rapidly during the first part of October. The generous rains over the Cross Timbers and parts of the Low Rolling Plains revived prospects for 1957 small grain crops. As soon as the fields dried, the farmers rolled out their drills to plant wheat, barley, and oats. More thundershowers and a few heavy downpours hit the Del Rio-Uvalde County. The rains were very spotted, however. More rains were needed in the northern High Plains and in East Texas. Even in the most favored areas, the drought was not broken. The sub-soil moisture had become depleted in all parts of the State and more rains were needed to keep the small grains growing and to replenish the sub-soil moisture reserves. The rains which fell at the end of the month brought more renewed hopes to farmers and stockmen. At the end of the month harvest of grains was moving into the final stages. The harvest of cotton continued in full swing in the High Plains and in the extreme western part of Texas but was complete over most of the rest of the State. The clear weather in South Texas was favorable for the harvest of the early vegetables. Lack of rains in some dry-land areas held back the planting of onions but growers in the irrigated areas at Laredo, Winter Garden, and Eagle Pass prepared land for more vegetables. Winter grass, weeds, and small grains responded to the improved moisture conditions over much of the eastern two-thirds of the State.

Weather Records Processing Center
U. S. Weather Bureau
Kansas City, Missouri

STORMS

October 1: During a flash shower and electrical storm at Lexington, 11 head of cattle were electrocuted as they stood in shelter under a tree.

October 2: Lightning struck a large sheet metal, rock, and frame barn at Fredericksburg, destroying it and most of its contents which included farming equipment and 6,000 pounds of feed.

October 3: Strong winds and hail the size of golf balls, lasting only about 15 minutes, hit in an area about three miles square, There was damage to roofs, windows, small outbuildings, and farm equipment at Six Mile Community about six miles northwest of Port Lavaca. Exterior paint finishes were damaged, telephone service disrupted, and a water pump was torn loose from its foundation and hurled into a nearby field. A wind guage registered 85 m.p.h. and then was blown down.

A funnel-shaped cloud, not touching ground, was sighted 40 miles northeast of Dallas at 8:28 p.m.

October 4: At Bishop, Calallen, Driscoll, Edroy, Odem, and Robstown, in the Corpus Christi area, a heavy thunderstorm built up about noon, moved southward skirting Kingsville and entered Mexico near Mission. A steel grain elevator under construction at Elroy collasped in the wind, which was estimated at Elroy to have reached 70 m.p.h. Rainfall totaled 1.16 inches, most of which fell within a 15-minute period.

Calallen winds were estimated at 56-60 m.p.h. but no serious damage was reported. At Robstown the thunderorm hit about 1:30 p.m. causing damage in town to TV antennas and signboards. At a service station considable wind damage was sustained. At Driscoll a grain elevator and a cotton picking machine were damaged; veral small homes and outbuildings northeast of Bishop were damaged, where a tornado funnel was seen to rike a poultry barn. State police reported a funnel between Corpus Christi and Robstown.

Port Arthur two injuries, one serious, were sustained when hail and a small tornado struck the southwest rt of the city at 3:25 p.m.

Beaumont high winds and hail caused property damage.

Jasper hailstones of two and one-half inch diameter fell over an area of 12 square miles for a period of -15 minutes. Considerable damage was caused to the maturing pecan crop, while destruction and damage to al and other property amounted to several hundred thousand dollars, according to insurance figures.

tober 14: Wind, rain, and hail wiped out approximately 80% of the cotton crops at Estelline during storms ich began about 5:00 p.m. Heaviest damage occurred around 9:00 p.m. In a 10-mile area from the town two-ch rainfall was average and in town four inches were measured. An automobile was heavily damaged when a ll of water washed it off the highway. Roofs and winter screens on buildings also suffered heavy damage.

tober 15 and 16: Six funnel clouds were sighted 25 and 30 miles northwest through southwest of Corpus risti, evening of October 15, and one funnel cloud was sighted the morning of October 16 at WBAS Corpus risti. None touched ground.

the Morton area west of Lubbock, around midnight, golf-ball-size hail and high winds accompanied downpours ich destroyed cotton crops. An estimated 10,000 to 15,000 acres were involved. Vehicles were battered by e hailstones, windows were knocked out, and sections of roofs were badly damaged. Other areas reporting hail mage on the night of October 15 were Goodland, Bula, Progress, and Bledsow.

tober 17: At Hereford lightning killed a 34-year-old construction foreman and injured two other persons. t seriously, at work.

tober 18: Between 7:00 and 8:00 a.m. at Crystal City a tornado demolished two homes, ripped roofs off hers, and damaged a warehouse.

brief severe windstorm struck approximately 12 miles east of Del Rio shortly before 7:00 a.m. disrupting mmunication lines. The greatest damage was to the communication system, although barns and windmills in the ea sustained some damage.

Sycamore Creek near Del Rio between 2:10 a.m. and 2:30 a.m. a wind of high velocity, accompanied by heavy in, blew the porch off a railroad section house and damaged barns and roofs of houses. Telephone poles were own down.

tober 20: A small tornado dipped to the ground just northeast of Austin. Oak trees and oat fields were maged. After touching down, the tornado dissipated. One inch of hail fell in North Austin.

squall line moving southeast toward Corpus Christi brought high winds with gusts to 50 m.p.h., hail, and avy rains across south central Texas. Four tornadoes were sighted in the Tilden area, hitting open country out 1:35 p.m. Two funnel clouds were reported in the Corpus Christi area during the squall line passage. mbs of trees were torn off and TV antennas and signs were blown down in heavier wind areas. Building mage was reported at Robstown, Edroy, Simmons, Ray Point, and Beeville. The damage was limited to roofs and ate glass windows.

tween 2:20 p.m. and 2:50 p.m. several funnel clouds were sighted in the vicinity of Bryan, Texas. Bryan AF se reported 104 m.p.h. winds. Three funnels were sighted at College Station at one time. Approximately 15 rcraft were badly damaged by high winds. TV antennas all over the cities of Bryan and College Station were nt and damaged, tree limbs broken, and sheet metal roofs on buildings blown off. Hail was reported at near-towns.

Seguin a small funnel cloud touched the ground between 4:00 and 4:25 p.m. moving southeast and east. No in, but small hailstones accompanied it. One home and a barn were completely demolished and the roof was moved from another. Trees were broken off. One woman was cut by flying debris.

Beaumont a severe thunderstorm damaged utilities and TV antennas at about 5:00 p.m. Tree limbs were broken d there was some minor roof damage. One house was damaged by lightning. Three persons were injured. The stest mile at Jefferson County Airport was 65 m.p.h. west northwest at 5:25 p.m. with light hail. At Port thur considerable damage was done by winds, principally to utility installations and TV antennas of which at ast 1,000 were blown down or twisted out of shape. Tree limbs were broken off, plate glass display windows re broken and contents were damaged or lost. Metal awnings were ripped from stores and homes. Many boats re overtruned in a nearby lake. Minor damage was reported at Orange.

Galveston four persons were drowned and one was electrocuted by a hanging power line during a heavy thunder-orm. There was some light hail between 4:25 and 4:45 p.m., and wind gusts to 65 m.p.h. Many boats capsized Galveston Bay. Plate glass windows were borken, TV antennas were blown down, and there was minor damage to gnboards and flimsy structures on the mainland. There was no appreciable damage on Galveston Island.

severe thunderstorm with some hail occurred in the Brownsville area about 9:00 p.m. Strong winds ripped off garage roof and the bed of a truck, and numerous trees were blown down. Strongest wind recorded at Browns-lle Airport was 43 m.p.h. from northwest but strongest wind was from south-southwest over west part of the ty.

tober 24: A funnel was sighted aloft 35 miles northwest of Big Spring at 10:13 p.m.

tober 29: Strong winds blew down an oil rig just south of Borger.

tober 30: Fire, apparently caused by lightning, destroyed a building and contents about 2:00 a.m. at San gelo.

(A) EVAPORATION MEASURED IN A SUNKEN PAN OF 24-INCH DIAMETER. (C) EVAPORATION MEASURED IN A SCREENED, SUNKEN PAN OF 48-INCH DIAMETER. MAX AND MIN IN TAB E R REFER TO EXTREMES OF TEMPERATURE OF WATER IN PAN AS RECORDED DURING THE 24 HOURS ENDING AT TIME OF OBSERVATION.

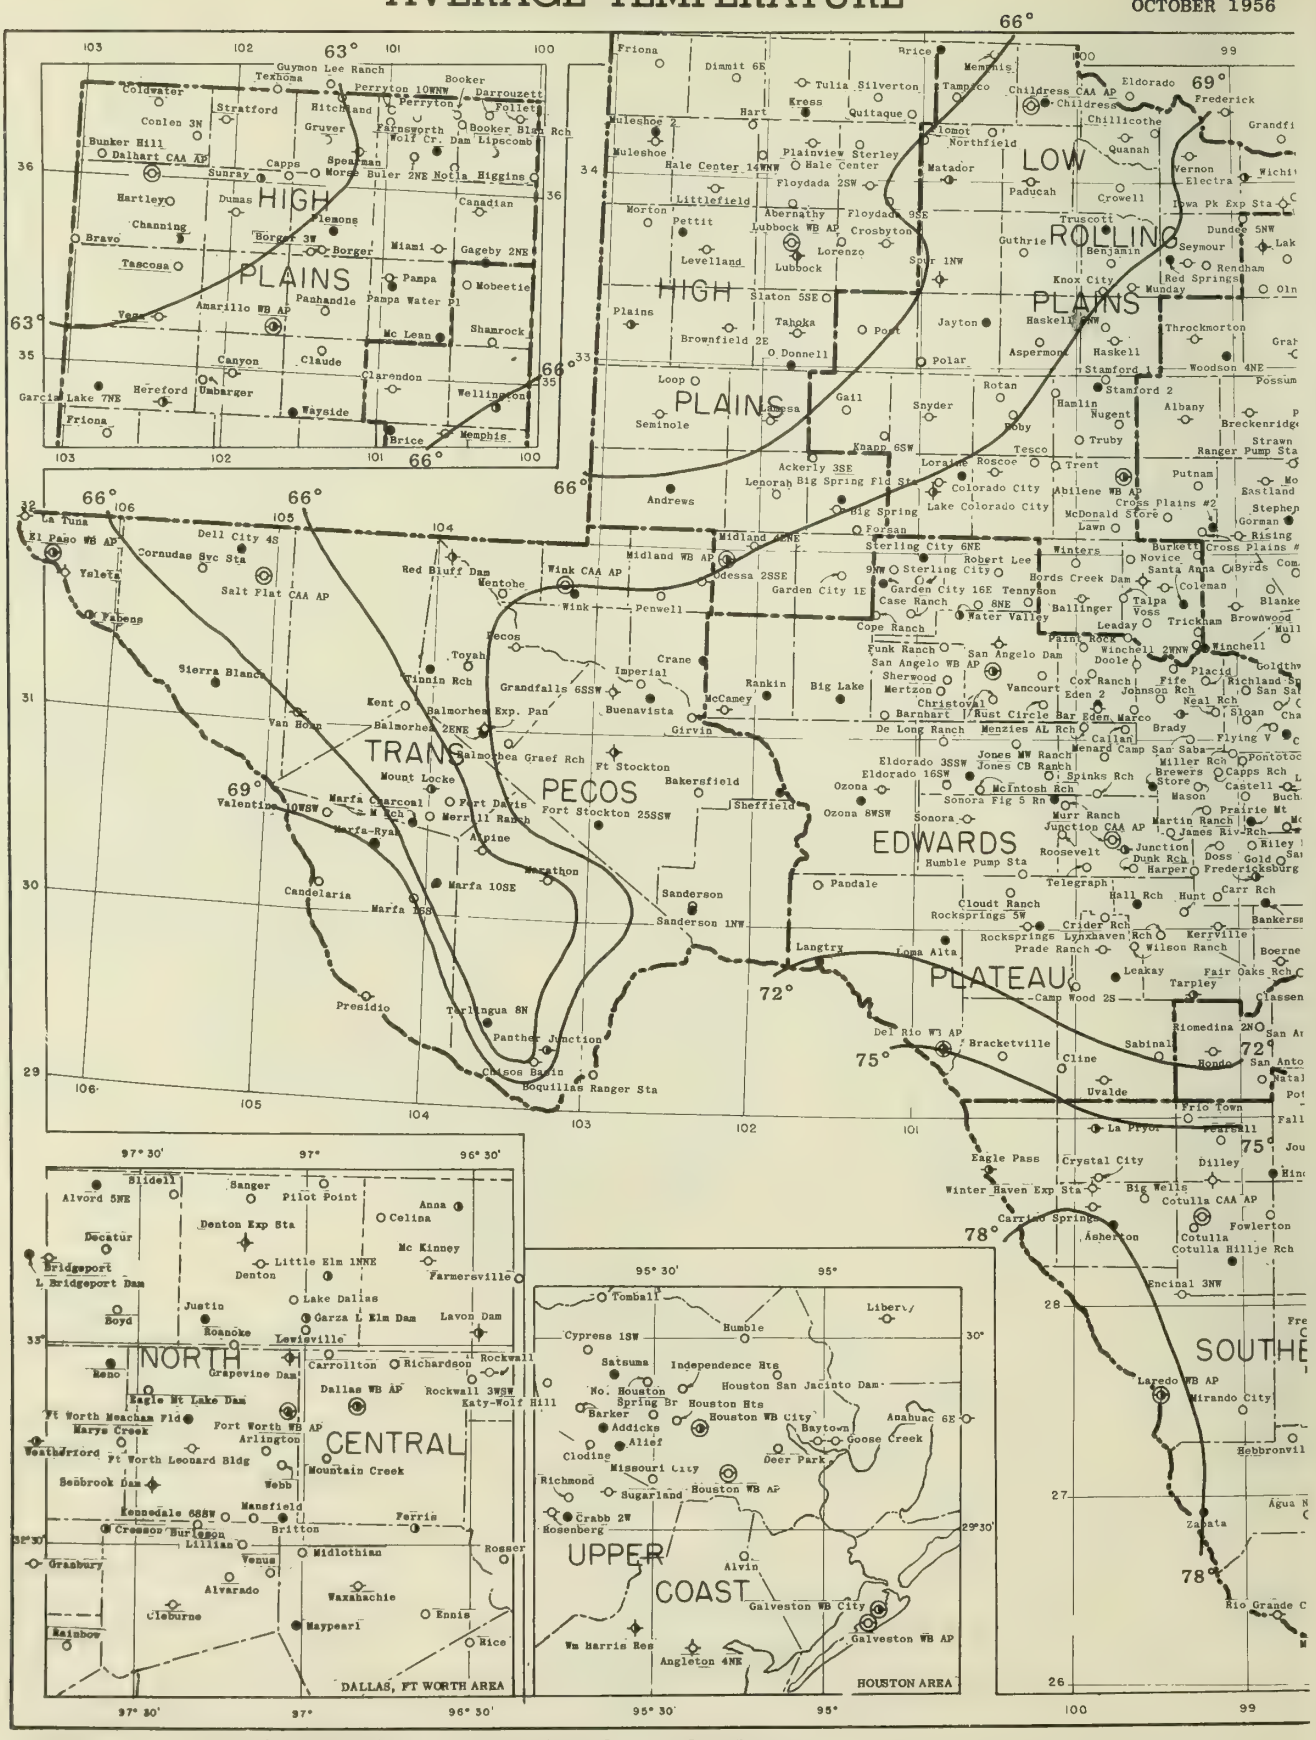
See reference notes following Station Index.

TOTAL PRECIPITATION

OCTOBER 1956

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

TOTAL PRECIPITATION



OCTOBER 1956

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

AVERAGE TEMPERATURE

OCTOBER 1956

Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

OCTOBER 1956

Isolines are drawn through points of approximately equal values.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent samples published in Table 7 are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index lists observation times in local standard time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
•	Amount included in following measurement, time distribution unknown.
#	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
/	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One to nine days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

ASHEVILLE: 1957

TEXAS - NOVEMBER 1956

WEATHER SUMMARY

November was relatively cool. The western third of the State continued very dry. Small grains, winter grasses, and weeds responded rapidly to the early November rains over the eastern two-thirds but follow-up rains failed to materialize except in some north central and northeastern counties. Over much of the State, livestock were being maintained on shipped-in hay and range pellets. Agricultural activities centered around the completion of the harvest of late fall crops and planting for next year's production.

Most stations in the Lower Valley, along the Upper Coast and in parts of south central Texas registered their highest temperatures for the month during the first few days. The mercury reached 95 degrees at Rio Grande City on the 1st, that being the highest temperature for the State. Other parts of the State, however, remained cool during the first nine days as northerly winds poured polar continental air over Texas. As a high pressure center moved eastward over the Gulf, gentle southerly winds brought warmer weather which prevailed from the 10th to 14th. The 11th and 12th were especially warm over the Trans-Pecos, the Plains, and Edwards Plateau. The 14th was warmest over north central and east Texas. Maximum temperatures on those afternoons were mostly in the 80's. A fast-moving cold front moved into the State on the afternoon of the 14th and by late on the 15th had passed Brownsville. The "norther" which followed brought sub-freezing weather to the Panhandle and clear and cold weather to the other sections. Warm humid air returned on the 18th and 19th but another cold front entered the State on the 19th and by the end of the 20th had crossed the entire State. The "norther" which followed brought sub-freezing temperatures to the Panhandle and west Texas. Most stations in those areas registered their lowest minimums on the 21st and 22d. A dry cold front which moved across Texas on the 27th and 28th dropped the temperatures below freezing over much of the State. Temperatures dropped to the middle 30's as far south as Brownsville. Most stations registered their lowest temperatures for the month on the 27th, 28th, or 29th. The coldest temperature for the State, 10 degrees above zero, occurred at Seymour on the 29th. Monthly mean temperatures ranged from 39.9 degrees at Stratford to 68.5 degrees at Port Isabel. Monthly mean temperatures were below the long-term means at all except a very few stations. Temperature departures ranged from +2.5 degrees at La Pryor to -6.7 degrees at Crockett. In general, the largest negative departures were over the northern parts of Texas and the few positive departures were scattered over the southern sections.

Thunderstorms dumped generous rains over the eastern two-thirds of the State on the 2d, 3d, and 4th. The largest amounts fell over north central and east Texas. Lighter showers fell over the extreme east on the 5th, 6th, 14th, 15th, and 16th. Little other precipitation of importance fell during the month. Precipitation totals over the western half of the State were generally less than one-half inch and numerous stations in the High Plains and Trans-Pecos received no rain or only light sprinkles. Most stations in north central and east Texas and in the Upper Coast section received more than one inch. Several stations in the north central section, and most stations in East Texas received more than three inches. The greatest monthly total, 7.66 inches, fell at Hagansport. Several other stations in that general area received more than five inches. Snowfall during the month was negligible. A few flakes fell at Amarillo, Lubbock, and a few other stations. Precipitation in a few counties in east and north central Texas exceeded the long-term means but negative departures were the rule elsewhere. Most stations over the western half of the State received less than one-fourth the long-term means for November.

Muddy fields brought rejoicing and renewed hopes to farmers and stockmen early in November when the most generous rains since spring were uploaded over much of the State. The intermittent showers, which continued for several days, brightened the prospects for small grains, legumes, and pastures eastward from a line joining Childress, San Angelo, San Antonio, and Houston. Lesser amounts fell west and south of that line and the High Plains, the western Plateau, Trans-Pecos, and South Texas received none or only light sprinkles. As the fields dried over the eastern two-thirds of the State, the tractors rolled early and late planting small grains and winter legumes. Earlier planted wheat, oats, and barley in that area made excellent growth. On the morning of the 9th, freezing temperatures ended the growing season over the northern half of the State and light frost nipped the tender vegetation in the south central and southeastern counties.

The extreme east and counties along the Gulf received scattered showers after the first week but little rain of importance fell elsewhere. The recurring dry northers depleted the surface moisture, slowed the growth of small grains, and faded small grain and winter pasture prospects. On the morning of the 27th, the freezing isotherm pushed into the upper coast and deep into south Texas. Frosty mornings were followed by shirt-sleeve weather in the afternoons. Wheat fields in the northwest continued to take a beating from blowing dust and lack of moisture. Cotton harvest in the High Plains reached the scrapping stage and strippers were fast cleaning up the remaining fields. Growers were still digging late peanuts. Pecans moved to market from the major producing areas. Harvest of winter-type vegetables was under way in all irrigated areas except in the Coastal Bend. Low temperatures reduced the crop of fall tender vegetables.

Climatologist
Weather Records Processing Center
Kansas City, Missouri

STORMS

On November 1st at about 10:30 a.m., in the vicinity of Matador, a north wind estimated at seventy to seventy-five miles per hour, caused one of the most severe dust storms in memory. Visibility was reduced to zero; trees of eight-inch diameter were uprooted and blown down; television antennas, shingles, and tarpaper from roofs were blown away. Some late cotton was covered by blowing sand in the fields. The storm continued until noon of November 2d.

On November 3d, at 11:50 a.m., a small tornado struck the Gulf coast town of Port Acres near Beaumont. No injuries were reported. Two houses were lifted from their foundations. Six garages and a carport were knocked down. Power and telephone service was disrupted. Roofs were torn from barns and other buildings.

Richard D. Blood
State Climatologist
U. S. Weather Bureau
Austin, Texas

FLOODS

General heavy rains fell over the Upper Trinity watershed from November 2d to 4th. The average fall over the West Fork was about two inches, over the Elm Fork about three inches, and the heaviest fall was over the East Fork and Trinity below Rosser to Long Lake, including Cedar, Chambers, and Richland Creeks with a maximum fall of 7.5 inches in the Mabank area. All streams were very low and the surface very dry resulting in little runoff in areas of less than four inches of rainfall. Cedar Creek at Mabank was a few inches above the banks on November 5th and 6th.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1710 Wilshire Blvd., Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

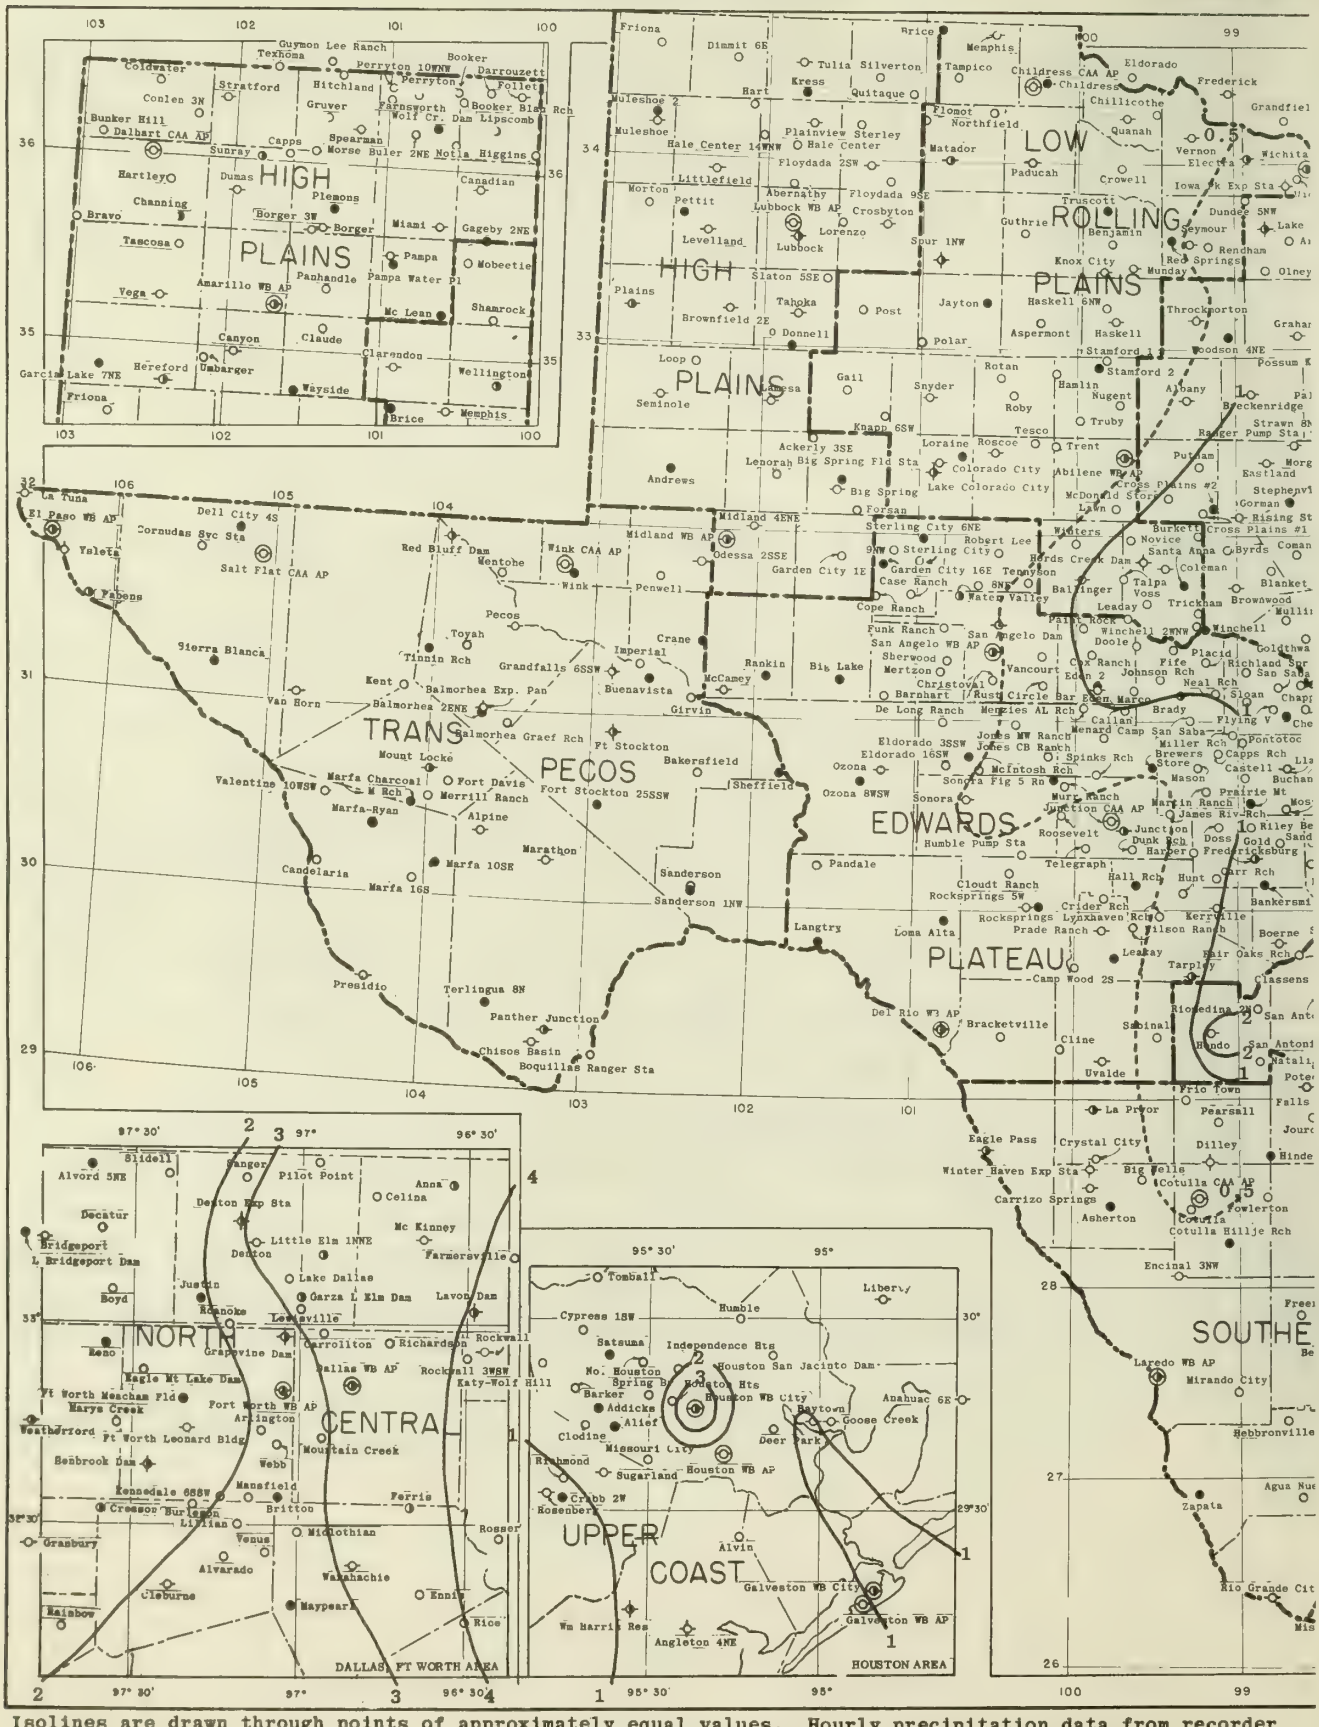
Water equivalent samples published in Table 7 are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index lists observation times in local standard time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+ And also on a later date or dates.
* Amount included in following measurement, time distribution unknown.
Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
// Gage is equipped with a windshield.
AM Data based on observational day ending before noon.
AR This entry in time of observation column in Station Index means after rain.
B Adjusted to a full month.
C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M One to nine days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T Trace, an amount too small to measure.
V Includes total for previous month.
SS This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.



Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

NWRC, Asheville, N. C. -- 1-9-57 -- 1650

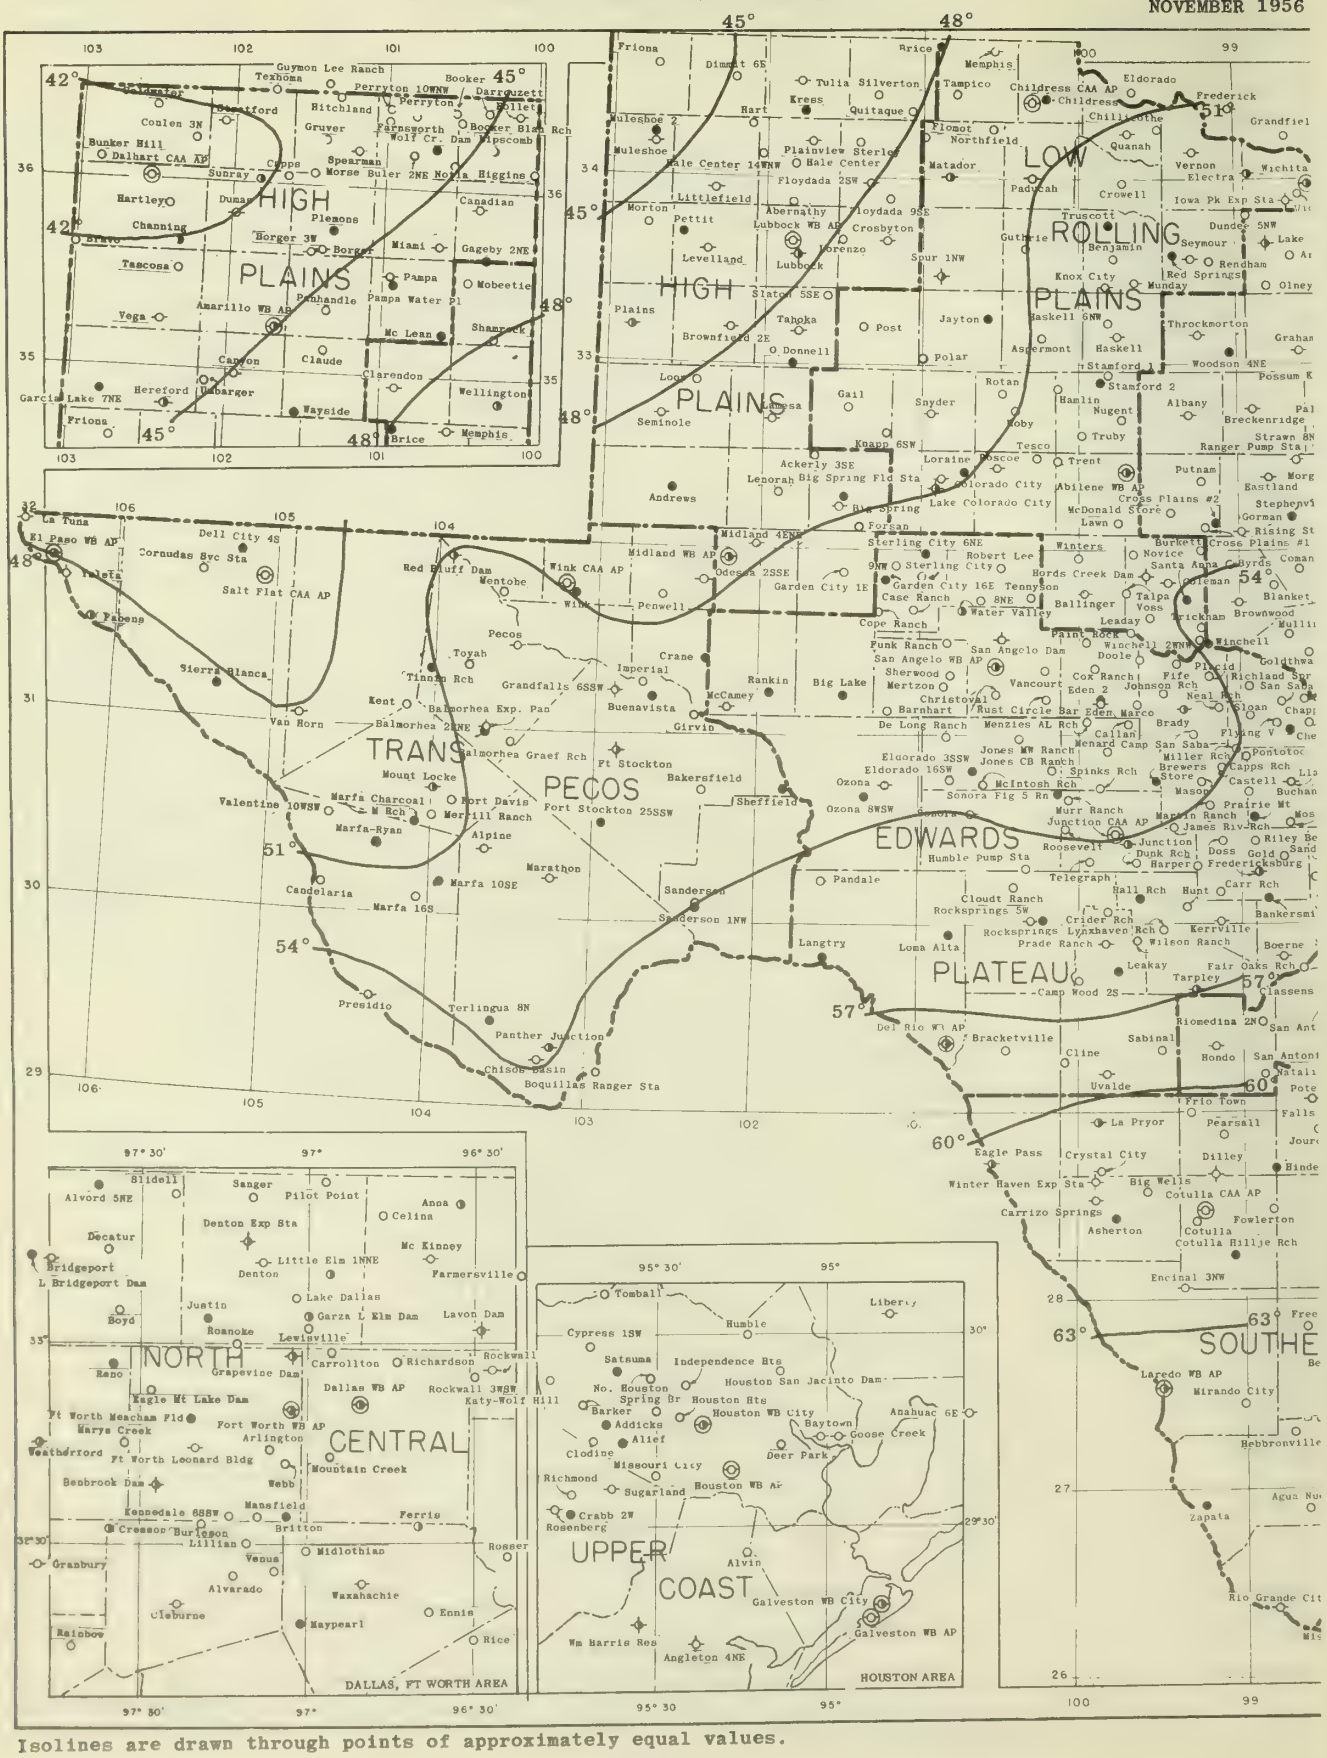
See reference notes following Station Index.

TOTAL PRECIPITATION

NOVEMBER 1956

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data."

TOTAL PRECIPITATION



NOVEMBER 1956

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

AVERAGE TEMPERATURE

NOVEMBER 1956

Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

NOVEMBER 1956

Isolines are drawn through points of approximately equal values.

TEXAS - DECEMBER 1956

WEATHER SUMMARY

December was seasonally mild. Soaking rains fell over some of the eastern portions of the State but drought continued over much of the west. Western ranges were at or near the record low level of condition. Livestock were in poor to fair condition depending on the rations they received. Strippers cleaned up the scrappings of the 1956 cotton crop on the High Plains. Growers in South Texas and the Lower Valley moved hardy type winter vegetables to market.

The first few days of December were very mild over most of the State. Almost all stations registered their highest afternoon temperatures during the first week. A few stations registered their highest monthly maximums during the brief warm period at the end of December. Monthly maximum temperatures ranged from the upper 60's over the extreme west to the upper 80's over south Texas. The highest temperature for the State, 90°, occurred at Rio Grande City on the 6th and 7th. Monthly maximums were mostly in the 80's over the central and eastern sections and in the 70's over the Plains, the Trans-Pecos, and Edwards Plateau. A cold front moved into the Panhandle late on the 5th and by late evening on the 8th the entire State was in the cold air. The dry norther dropped temperatures from the 70's and 80's to below freezing over the northern portions. Many northern stations registered their lowest temperatures for the month on the morning of the 9th. The lowest minimum for the State, 6° above zero, occurred at Stratford on the 9th and 10th. Temperatures increased to slightly above seasonal on the 11th and 12th before another dry norther moved across the State. Sub-freezing temperatures occurred over the northern portions of the State on the morning of the 13th and 14th. Another cold front brought low temperatures on the 24th and 25th. Numerous stations over the southern part of Texas registered their lowest temperatures on Christmas morning. The last few days of December were mild and pleasant. Monthly mean temperatures ranged from 37.6° at Stratford to 66.2° at Port Isabel. Monthly mean temperatures were above the long-term means at all stations except El Paso and Follett. Temperature departures ranged from -0.3° at Follett to +6.7° at Memphis. Temperature departures were, in general, smallest over the Trans-Pecos, Edwards Plateau, and South Texas and largest over the northern Plains.

No precipitation of importance fell in the State of Texas during the first few days. The cold front which crossed the State from the 5th to the 8th produced scattered showers over the north and northeast but little rain elsewhere. Frontal activity triggered a few thundershowers along the Upper Coast on the 12th and 13th. The rest of the State continued dry. Soaking rains fell east of a line from Wichita Falls through Abeline to Corpus Christi from the 17th to 22d. The heaviest amounts fell in the Palacios, Galveston, and Beaumont vicinities. No important precipitation occurred during the last week of December. Several stations in the High Plains received no rain or only light sprinkles during the month. Most stations over the High Plains, the Low Rolling Plains, Trans-Pecos, Edwards Plateau, South Texas, and the Lower Valley received less than an inch of rain during December. Most stations in the eastern sections received more than two inches and scattered stations in those sections received more than four inches. The greatest monthly total 15.06 inches, fell at Orange. Rainfall over a few areas exceeded the long-term means. These areas included parts of the Upper Coast, an irregular band extending from George West and Beeville northward to Quannah and Sherman, and a number of scattered localities. Many stations in the northeast and most counties over the western half of the State received less than half the long-term means. Snow flurries occurred over parts of the High Plains and in the extreme western portion of the State on a few days. The greatest snowfall, 2.3 inches, fell at El Paso.

Several dry northers crossed Texas during December. They kicked up dust storms over the High Plains and depleted the scant surface moisture over other parts of northern and western Texas.

Slow rains over the eastern two-thirds of the State a few days before Christmas revived winter grain and pasture prospects. Dryland wheat in the High Plains deteriorated steadily. Irrigated wheat in the High Plains was dormant but in generally good condition. Harvest of hardy vegetables got under way in South Texas and supplies moved in good volume. In the Lower Valley, growers began planting spring-crop cantaloups and tomatoes in areas watered from wells. Non-irrigated areas were deficient of moisture. Citrus marketings continued but most fruit, especially grapefruit, were small. North Texas cotton growers were preparing seed beds for starting their 1957 crop.

Mid-December rains followed by mild temperatures revived small grain and winter grass prospects over the eastern two-thirds of the State. Supplemental feeding of commercial feeds and shipped-in hay eased in the east but continued in the west where the herds were maintained almost completely on purchased feed. Cattle and sheep were in poor to fair condition.

See reference notes following Station Index.

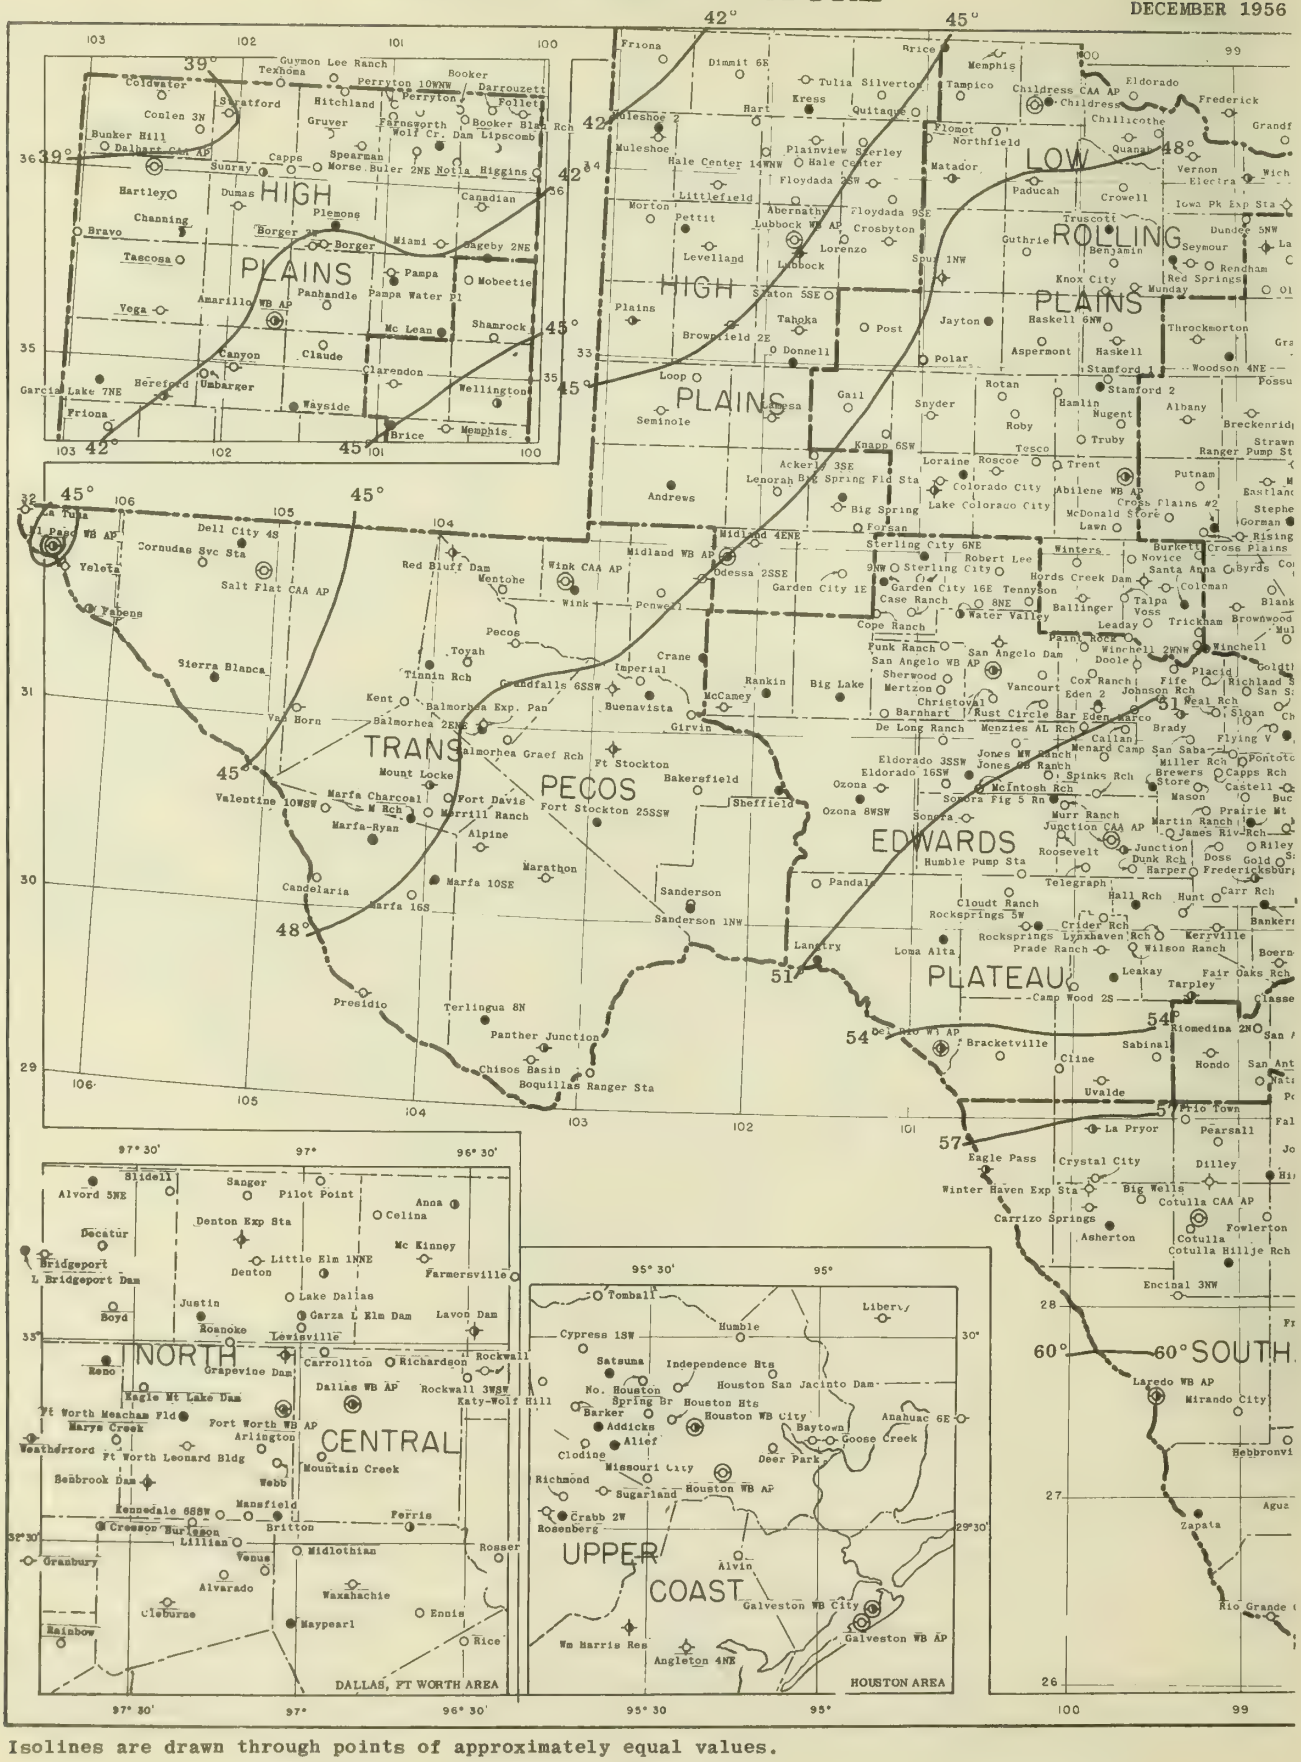
TOTAL PRECIPITATION

DECEMBER 1956

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

TOTAL PRECIPITATION



DECEMBER 1956

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

AVERAGE TEMPERATURE

DECEMBER 1956

Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

DECEMBER 1956

Isolines are drawn through points of approximately equal values.

REFERENCE NOTES

Additional information regarding the climate of Texas may be obtained by writing to the State Climatologist at Weather Bureau Airport Station, 1779 Wilshire Blvd, Austin 2, Texas, or to any Weather Bureau Office near you.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Divisions, as used in Table 2, became effective with data for October 1956.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Monthly degree day totals are the sums of the negative departures of average daily temperatures from 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Long-term means for full-time stations (those shown in the Station Index as "U. S. Weather Bureau") are based on the period 1921-1950, adjusted to represent observations taken at the present location.

Water equivalent samples published in Table 7 are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record. Water equivalent of snow on the ground is measured at selected stations when two or more inches of snow are on the ground.

Data in Tables 3, 5, and 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. The Station Index lists observation times in local standard time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. Consult the annual issue of this publication for interpolated monthly totals.
+	And also on a later date or dates.
•	Amount included in following measurement, time distribution unknown.
Ø	Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.
//	Gage is equipped with a windshield.
AM	Data based on observational day ending before noon.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in "Hourly Precipitation Data".
D	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One to nine days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittance and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Information concerning the history of changes in locations, elevations, exposure, etc., of substations through 1955 may be found in the publication "Substation History" for this state. That publication may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. for $1.00. Similar information for regular Weather Bureau stations may be found in the latest issues of Local Climatological Data Annual, obtained as indicated above, price 15 cents.

NWRC, Asheville, N. C. -- 2-7-57 -- 1650

CORRECTIONS

February 1956:	Iowa Park Experiment Station, Table 2, total snowfall should be missing.
March 1956:	Carrizo Springs, Table 2, precipitation departure should be -1.06.
	Encinal 3 NW, Table 2, precipitation departure should be -1.35.
July 1956:	Balmorhea Experiment Pan, Table 2, precipitation departure should be -1.44.
	Rocksprings, Table 2, precipitation departure should be -2.20.
August 1956:	Rocksprings, Table 2, precipitation departure should be -2.15.
September 1956:	Graham, Table 2, precipitation departure should be -1.97.
	Rocksprings, Table 2, precipitation departure should be -3.14.
	Vernon, Table 2, precipitation departure should be -2.32.
October 1956:	Karnack, Table 2, greatest day should be 0.58.

TEXAS - 1956

WEATHER SUMMARY

The drought which had been in progress in the Plains States from Nebraska southward for several years intensified in 1956. It became one of the worst of record. The area affected included most of the nonirrigated crop lands of Texas. Another important feature of the weather was the persistence of high temperatures from late in April to the end of October. The combined effects of the extreme drought and prolonged periods of high temperatures were reflected in reduced yields of forage crops; severe shortages of pastures and range feeds; the depletion of soil moisture reserves; low ground-water levels; and deficient streamflow. The following paragraphs summarize briefly the weather effects on the economy of the State, the general rainfall and drought pattern, and the annual march of temperature. A few of the more damaging storms are described briefly. For greater detail, the reader is referred to the monthly issues of Climatological Data, Texas and to Climatological Data, National Summary.

Mild spring temperatures followed a pleasant winter. Had moisture been available, the 1956 crop season would have gotten off to a fine start. But March 1956 was one of the driest of record. Few stations in the western half of the State received more than one-tenth inch of rain during the entire month. Most stations in the western three-fourths of the State received less than one-tenth their long-term March averages. Late April and early May rains revived hopes of obtaining crops over the eastern half of Texas. As the fields dried, tractors rolled early and late to overcome the early-season delay. Farmers from the Upper Coast to the High Plains rushed their planting to completion. The seed germinated quickly and the plants grew rapidly. Follow-up rains were scant except in the High Plains and the northern Blacklands and crops were suffering by June 1. By July 1, northern Blackland and Panhandle crops were also deteriorating. Intensified drought in July, August, and September made the 1956 crop season one of the most devastating of record to be remembered along with 1873, 1917, 1925, and the middle thirties. The impact on dryland production was more severe because of the cumulative effect of several years of deficient rainfall. Mr. J. Murray Mitchell, Jr., Climatologist, Office of Climatology, U.S. Weather Bureau, Washington, in "When and Where the Current Drought Began" (See: Weekly Weather and Crop Bulletin, XLIV, 1a, p.3.) showed that the drought had been in progress over western Texas since 1946 and over most of eastern Texas since 1950. During these drought years, the acreage of crops grown under irrigation had increased sharply as farmers attempted to avert failures caused by recurring droughts. Irrigated crops yielded exceptionally well in 1956 and production from that acreage increased the over-all production tremendously. Open weather at harvest time permitted getting mature crops out of the fields without delay.

Irrigated High Plains wheat produced good yields. Fair yields were combined in the northern Blacklands. But the rains were too little and too late for the struggling wheat over most of the Low Rolling Plains. A large acreage of sorghum was planted but critical drought caused heavy abandonment. There was a shift from grain to salvaging for forage. The sorghum forage yield was a record low but the grain yield on the acreage actually harvested was a record high. Hay production was near the record low per acre. Most of the hay acreage was grown without the benefits of irrigation. Cotton yields were the third highest of record. Because of the low prospective grain yield and the urgent need for roughage, a substantial portion of the corn acreage was salvaged by grazing or cut for forage or silage. The acreage actually harvested for grain was the least in 81 years. This combined with the relatively low average yield per acre, fifteen bushels, resulted in the smallest total production since 1873.

Heavy rains in February over the eastern third of Texas improved the spring range and feed prospects in that part of the State. Prospects for spring grass faded out to the west and there remained no hopes of range feed over much of the Plains, western Plateau, Trans-Pecos, and south Texas until soaking rains were received. Effective rains improved pasture feed prospects in south Texas in March but freezing temperatures and lack of moisture retarded development over other parts of the State. Hope dwindled as the ranges deteriorated steadily in April, May, and June. By July, many cattlemen and sheepmen struggled desperately to survive one of the worst droughts of record. They faced the hard decision of holding on in hopes of rain or liquidating their herds. The ranges were bare over a large part of the State. They remained bare except in a few spots where scattered showers fell in September. Hay and roughage supplies were far short of winter needs. There were no prospects for fall wheat or oats for pasture. Stock water became critically short or exhausted on many farms, especially in the eastern counties. The October and early November rains - the first general rains since May - revived hopes of winter range and feed prospects over a sizable portion of the State. December rains started the fall-sown small grains, grasses, and weeds but grazing remained short of the needs. Range and pasture feeds over practically the entire State were about eaten out and the general condition was at or near the record low level.

Cattle and calves were maintained in poor to fair condition depending on the rations of supplemental feeds they received. Mild temperatures helped stretch the available feed and reduced losses. Ewes came through the winter in poor to fair condition with heavy supplemental feeding.

The total production of commerical vegetables, including potatoes and strawberries, was eight percent above 1955. Practically all of the winter vegetables came from the irrigated areas of south Texas. Conditions were generally favorable for these hardy type crops. Quality and yields from irrigated areas were exceptionally good and production from dryland acreage was good considering the shortage of moisture. The planting of the late spring vegetables, mostly in the nonirrigated areas of the south central counties and in the eastern and northeastern counties, was made under fairly favorable conditions but the lack of rains during the critical growing periods reduced the yields. Drought cut the yields of nonirrigated summer vegetables. Irrigated summer-crop onions and potatoes in the Panhandle made very good yields. Low temperatures in late November reduced the production of tender vegetables in south Texas and lack of water for irrigation reduced the acreage of tender crops for fall harvest in the Lower Valley.

According to the Geological Survey, United States Department of the Interior (See: Water Resources Review, December 1956, page 3 and Annual Summary-Water Year 1956, page 14.), flow of many Texas streams was deficient and the flow of some streams was at or near record lows. The flow of Guadalupe River above Comal River at New Braunfels was deficient in 35 of the 36 months ending December 1956. Storage in major reservoirs decreased 23 percent of potential conservation capacity during the year. Water levels along the Balcones fault zone were at or near record lows at the end of the water year from Austin to Uvalde owing to the drought which was in its sixth year in that area. Water levels declined steadily in most of the heavily pumped irrigation areas. Irrigation from ground water was being tried in many new areas, even in the humid parts of the State.

The dry cycle began long before 1956. Precipitation was deficient over much of the State in two-thirds of the months from October 1950 to the end of 1955. Rainfall during the last 80 days of 1955 averaged only about one-third of seasonal. Few stations in Texas received enough precipitation to measure during the first half of January 1956. Numerous stations in the High Plains and in the Lower Valley received no precipitation during the entire month. Most stations in eastern Texas received more than five inches of precipitation during February but few stations over the western half of the State, except in the Panhandle, received more than an inch. Heavy snow fell over the Panhandle during the first few days of February. Eastern Texas received substantial showers from March 12 to 15 and light showers from the 20th to 22d. Little rain of importance fell over other parts of the State. Many stations in the west received no rain in April. Severe thunderstorms dumped hail and several inches of rain over northeast Texas on April 5 and heavy showers fell along the coast on the 23d. May rainfall ranged from none to two inches over the Trans-Pecos, the western edge of Edwards Plateau, and the southern High Plains but exceeded four inches over the Blacklands and parts of east Texas. June precipitation totals were less than half the long-term means at most stations. Widely scattered thundershowers brought temporary relief from the drought to some localities in July but the hot southerly winds sapped the

moisture quickly. Many stations did not even receive light sprinkles. A cold front produced general showers on August 19 and 20. The amounts were fairly generous in the High Plains and at scattered stations elsewhere but wide areas in south Texas, Edwards Plateau, West Texas, the southern High Plains, and the northern Low Rolling Plains received less than a half inch. For most stations, September 1956 was the driest of record. Numerous stations in the Plains, Cross Timbers, Blacklands, and east Texas received no rain in September. The first important rains in several months came to many Texas stations in the third week of October. Even so, most stations received less than half their long-term October averages. Thunderstorms dumped generous rains over the eastern two-thirds of the State from November 2 to 4. November totals over the western half of the State were generally less than a half inch and many stations in the High Plains received no rain or only light sprinkles. December precipitation was less than half the long-term means over the western half of Texas and at many stations in the northeast.

Annual precipitation totals ranged from less than five inches over the northern portion of the Trans-Pecos to more than 30 inches along the eastern edge of the State. In general, most stations over the western half of the State received less than 15 inches of rain during the year. Annual totals at most stations in the north central counties, in east Texas, and along the Upper Coast were more than 20 inches. Several stations in the Port Arthur vicinity received more than 40 inches. The greatest amount, 53.46 inches, fell at Orange. The precipitation at Orange exceeded the long-term annual mean by six percent. All other stations received less than their long-term annual means. Several stations in the Orange vicinity received more than 80 percent of their annual means. Rainfall over most of east Texas, the extreme north central counties, and at a few scattered stations exceeded 60 percent of the long-term means. Precipitation over the western portion of the Edwards Plateau, the southern Plains, and eastern Trans-Pecos was less than 40 percent of the annual averages and in the southern counties of the Trans-Pecos was less than 20 percent of the long-term averages.

Many stations received considerably less rain in 1956 than in any previous year of record. The annual total at Abilene, 9.78 inches, was the least annual total of record for that station. Amarillo experienced their driest year of record with 9.94 inches of rain in 1956. Not enough precipitation fell at Amarillo to measure during the last 72 days of the year. A new record-low was established at Dallas where the annual total was 21.75 inches. Del Rio set a new record with only 4.34 inches during the year. It was the seventh consecutive year with deficient rainfall at Del Rio.

The persistent drought became the subject of a number of studies by climatologists and others. Mr. R. W. Schloemer and Mr. W. H. Haggard, Climatologists, Office of Climatology, U. S. Weather Bureau, Washington, in "Drought" (See: Weekly Weather and Crop Bulletin, XLIV, 1a, January 10, 1956, page 1.) presented a chart which showed that the rainfall deficiency for the five-year period, 1952 to 1956, was more than 150 percent of the annual means over the northern High Plains and over most of western and southern Texas. Mr. Ray C. Nelson, Meteorologist, Weather Records Processing Center, U. S. Weather Bureau, Kansas City, in "Precipitation Deficiencies in Texas, Oklahoma, Kansas, and Missouri; January-September 1956" (See: Weekly Weather and Crop Bulletin, XLIII, 46, page 7.) included a chart which showed that during the first nine months of 1956, Texas west of 95 degrees west longitude was short on precipitation and that the greatest deficiencies were in the south central and southwestern parts of the State. Mr. Nelson pointed out that the drought had persisted for several years prior to 1956.

Mild temperatures predominated during the first half of January. A cold front crossed the State at the end of the second week introducing a chilling spell which continued, with minor interruptions, until early in February. Most stations registered their lowest temperatures for the year during that period. Freezing temperatures occurred over the entire State except in the Lower Valley and along the Gulf. Annual minimums were below 20 degrees northwest of a line from Del Rio to Waco and to Texarkana. The coldest temperature for the State, 2 degrees below zero, occurred at Mount Locke on February 3. Temperatures were quite changeable during March and April but averaged slightly above seasonal. May 1956 was the hottest of record at many stations. Hot weather predominated to the end of October. Temperatures soared to 100 degrees or higher at many stations on each afternoon from June 28 to August 19. The highest temperature for the State, 113 degrees, occurred at Presidio on June 15. Annual maximums exceeded 100 degrees except along the Gulf Coast. November was relatively cool but December was unseasonally warm. Annual mean temperatures ranged, in general, from the upper 50s over the northern High Plains to the middle 70s in the Lower Valley. Annual mean temperatures were slightly above the long-term annual averages except at a very few widely separated stations.

STORMS

A blizzard moved into the Panhandle on February 1. Snow and high winds continued for several days. More than 30 inches of snow fell in some parts of the High Plains. The snow blocked streets and highways and stopped all types of transportation. Travellers stranded in cars and busses on the High Plains were rescued by National Guardsmen and train crews. Twenty deaths were attributed to the five-day blizzard. As the storm moved southeastward, the snow changed to freezing rain or drizzle, and glazed the highways as far south as Austin and San Antonio.

On March 21, a pre-frontal squall line triggered tornadoes and violent thunderstorms in central Texas and southeastward to the Coastal Plain. Heavy rain and hail caused extensive damage to crops and other property.

Severe dust storms accompanied a cold front which moved across Texas on April 2 and 3. Winds reached 80 miles per hour. Visibility was reduced to zero in some localities. Power and communication were disrupted in some communities. Airplanes were grounded and busses ran several hours behind schedule. A quarter million acres that had not blown previously sustained moderate to severe erosion.

Numerous severe thunderstorms and tornadoes occurred during the late spring, summer, and autumn. Hurricane Flossy caused high tides and rough seas in the Corpus Christi area on September 23.

Details of these storms were published in Climatological Data, National Summary.

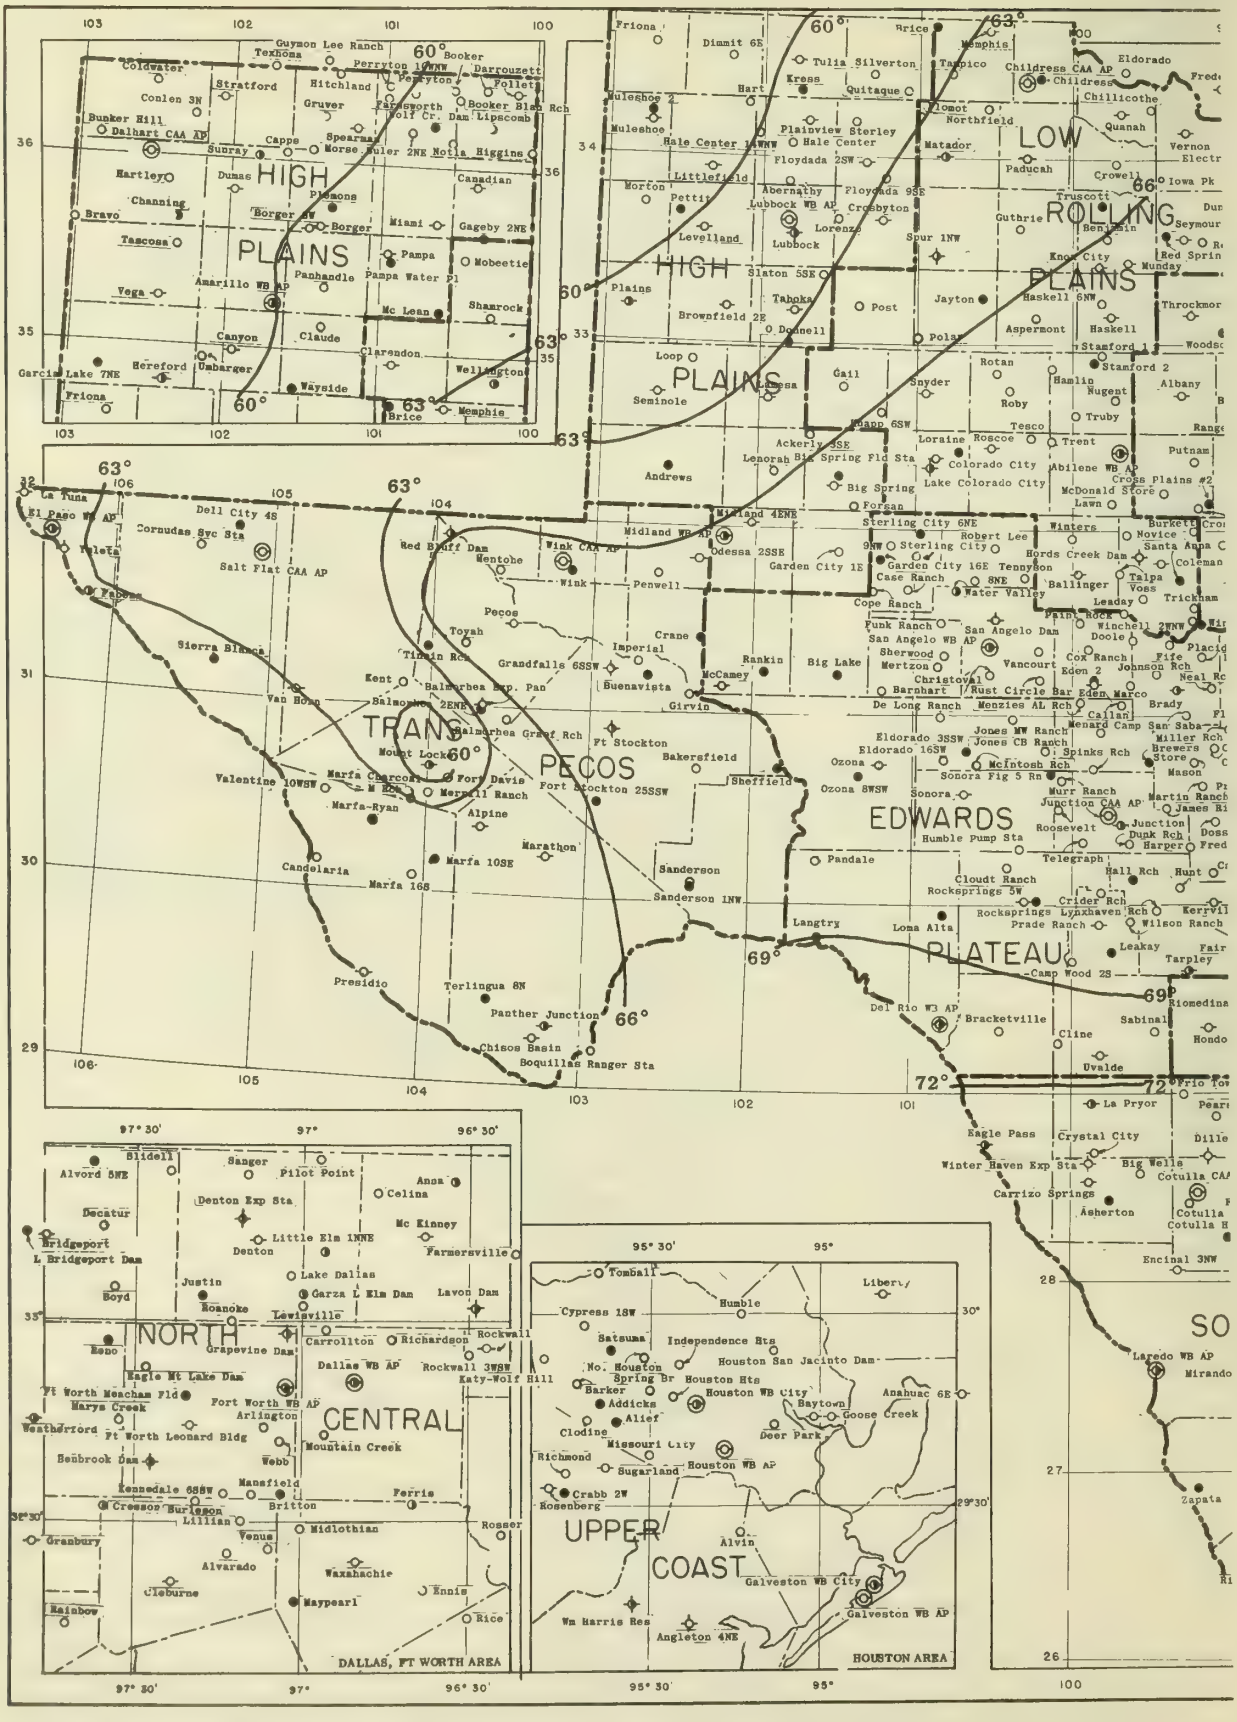
RELOCATION AND CHANGES OF EQUIPMENT

Arlington	Rain gage moved 1.1 mile SW	July 20
Bonita	Recorder moved 25 feet E	September 17
Brewers Store 5 SW	Recorder gage moved 5 miles SW	January 28
Brownwood	Equipment moved 120 feet NE	July 23
Buffalo	Rain gage moved 1.1 mile NE	February 1
Canadian	Equipment moved 500 feet NW	August 14
Centerville	Equipment moved 95 feet SE	October 24
Channing	Recorder moved 0.5 mile NNE	August 8
Clarksville 2 E	Equipment moved 2.7 miles ENE	September 19
Clodine	Rain gage moved 1000 feet NNW	March 27
Columbus	Rain gage moved 264 feet E	April 1
Comanche	Rain gage moved 400 feet SW	January 25
Copperas Cove	Rain gage moved 0.3 mile SSW	January 11
Cotulla	Recorder installed	March 19
Cotulla-Hillje Ranch	Recorder removed and standard gage installed	March 19
Dell City 5 S	Recorder moved 1 mile S	March 13
Eagle Pass	Rain gage moved 10 feet E	September 16
Eastland	Equipment moved 0.7 mile S	September 1
Ennis	Rain gage moved 30 feet N	June 7
Farmersville	Rain gage moved 8 feet NE	June 8
Flatonia	Shelter moved 70 feet S	September 24
Forsan	Rain gage moved 300 feet SSE	November 19
Fowlerton	Rain gage moved 1000 feet N	September 1
Freeport 1 NE	Rain gage moved 1 mile NE	November 1
Gageby 2 NE	Recorder moved 500 feet E	August 16
Gageby 1 W	Recorder moved 2.8 miles WSW	November 23
Gail	Rain gage moved 0.3 mile W	July 26
Gainesville	Equipment moved 1/2 mile S	July 27
Garza Little Elm Dam	Rain gage moved 3 1/4 mile WNW	January 23
Gilmer 2 S	Recorder installed	September 21
Grandfalls 3 SSE	Temperature and evaporation equipment removed	October 16
Grandfalls 3 SSE	Rain gage moved 5 miles NE	October 16
Haskell	Equipment moved 1.2 miles N	April 28
Hempstead	Rain gage moved 8 miles ESE	February 20
Hondo	Equipment moved 1/2 mile ENE	January 10
Hords Creek Dam	Recorder installed	April 30
Houston-Spring Branch	Rain gage moved 275 feet E	November 1
Indian Gap	Rain gage moved 400 feet E	September 1
Justin 4 S	Recorder gage moved 4 miles S	January 1
Kaufman	Equipment moved 2 miles E	August 1
Llano	Equipment moved 1 mile SSW	January 27
Loma Alta	Recorder moved 900 feet W	September 13
Longview	Equipment moved 0.4 mile NE	October 19
Mason	Temporary equipment installed	December 1
Natalia	Rain gage moved 35 feet N	June 12
Odessa	Rain gage moved 4.7 miles NW	October 22
Odessa	Temperature equipment removed	October 22
O'Donnell	Recorder moved 0.4 mile E	March 1
Olney	Equipment moved 0.3 mile ESE	August 1
Pep	Recorder moved 8.2 miles NNW from Pettit	August 1
Randolph Field	Recorder moved 80 feet W	September 18
Richmond	Rain gage moved 0.2 mile NE	June 1
Ringgold	Rain gage moved 0.35 mile SE	April 25
Rocksprings	Temperature and standard gage moved 5.3 miles E from Rocksprings 5W	June 13
San Antonio Nursery	Recorder moved 350 feet NW	September 18
Sunray	Recorder moved 0.3 mile N	August 9
Tampico	Rain gage moved 6 miles W	November 21
Terlingua 8 N	Recorder moved 125 feet N	March 3
Three Rivers	Rain gage moved 750 feet E	June 12
Washington State Park	Equipment moved 0.8 mile SSE	February 21
Water Valley 11 ENE	Rain gage moved 5 miles SE	October 24
Wellington	Rain gage moved 0.4 mile SE	November 24

TOTAL PRECIPITATION

Isolines are drawn through points of approximately equal values. Hourly precipitation data from recorder substations will be available in the publication "Hourly Precipitation Data".

TOTAL PRECIPITATION



1956

Isolines are drawn through points of approximately equal values. Hourly precipitation date from recorder substations will be available in the publication "Hourly Precipitation Data".

AVERAGE TEMPERATURE

1956

Isolines are drawn through points of approximately equal values.

AVERAGE TEMPERATURE

1956

Isolines are drawn through points of approximately equal values.
